JM Barnett

Prepared for
the U.S. Department of Energy
under Contract DE-AC05-76RL01830

Pacific Northwest National Laboratory
Richland, Washington 99354

Summary

The U.S. Department of Energy (DOE) Office of Science (SC) Pacific Northwest National Laboratory Richland campus (PNNL-Richland campus) facilities with the largest potential for radioactive air emissions are those at the Physical Sciences Facility. Operations conform to the Washington State Department of Health-issued Radioactive Air Emissions License-005.

This report documents radionuclide air emissions that result in the 2023 highest effective dose equivalent (EDE) to an offsite member of the public, referred to as the maximally exposed individual (MEI). The report has been prepared in compliance with the Code of Federal Regulations (CFR), Title 40, Protection of the Environment, Part 61, National Emission Standards for Hazardous Air Pollutants (NESHAP), Subpart H, “National Emission Standards for Emissions of Radionuclides Other than Radon from Department of Energy Facilities” and Washington Administrative Code (WAC) Chapter 246-247, “Radiation Protection—Air Emissions.”

Federal regulations in 40 CFR 61, Subpart H, require the measurement and reporting of radionuclides emitted from DOE facilities and the resulting offsite dose from those emissions. While the regulations are intended for the measurement of point source emissions, they include fugitive emissions with regard to complying with the dose standard. The regulations impose a standard of 10 mrem/yr EDE, which is not to be exceeded. Washington State adopted the 40 CFR 61 standard of 10 mrem/yr EDE in its regulations and reporting of the EDE to the MEI from both point source emissions and any fugitive source emissions of radionuclides. WAC 246-247 further requires the reporting of radionuclide emissions, including radon, from all PNNL-Richland campus sources.

The total radiological dose to the MEI from all PNNL-Richland campus radionuclide emissions in 2023, including fugitive emissions and radon, is $2.1\text{E-}05$ mrem ($2.1\text{E-}07$ mSv) EDE, or more than 100,000 times less than the federal and state standard of 10 mrem/yr, with which the PNNL-Richland campus is in compliance. The PNNL-Richland campus MEI dose from 2023 routine emissions (excluding radon) from registered sources is $2.0\text{E-}05$ mrem ($2.0\text{E-}07$ mSv) EDE. The dose from radon emissions is $4.0\text{E-}07$ mrem ($4.0\text{E-}09$ mSv) EDE. No unplanned releases from campus facilities occurred in 2023.

For further information concerning this report, contact Thomas M. McDermott, DOE Pacific Northwest Site Office, by telephone at (509) 372-4675 or by email at tom.mcdermott@science.doe.gov.

1.0 Introduction

This report documents calendar year (CY) 2023 radionuclide air emissions from the U.S. Department of Energy (DOE) Office of Science (SC) Pacific Northwest National Laboratory Richland campus (hereafter, PNNL-Richland campus or campus), and the resulting effective dose equivalent (EDE) to the maximally exposed individual (MEI) member of the public. This document complies with reporting requirements in the Code of Federal Regulations (CFR), Title 40, Protection of the Environment, Part 61, National Emission Standards for Hazardous Air Pollutants, Subpart H (2002), “National Emission Standards for Emissions of Radionuclides Other than Radon from Department of Energy Facilities,” and in Washington Administrative Code (WAC) Chapter 246-247 (2019), “Radiation Protection—Air Emissions.” This report satisfies the annual reporting requirements under the DOE PNNL-Richland campus license, Radioactive Air Emissions License (RAEL)-005, for CY2023 operations.

This report is available online at <https://science.osti.gov/pnso/Resources>.

Battelle Memorial Institute (Battelle) is contracted to operate PNNL for DOE-SC. Battelle manages operations at the PNNL-Richland campus and other leased/occupied research and office areas nearby. Activities at the campus include research and development in the physical, chemical, life, and environmental sciences, and relevant environmental monitoring.

1.1 PNNL-Richland Campus Description

The PNNL-Richland campus (PNZO 2013) is located in southeastern Washington State (Figure 1.1). It is adjacent to the much larger DOE Hanford Site (Figure 1.2). The campus occupies 1.2 mi² (3.0 km²) just south of the Hanford Site 300 Area, whereas the Hanford Site occupies about 580 mi² (1,500 km²).

The campus lies about 170 mi (275 km) east-northeast of Portland, Oregon; 170 mi (270 km) southeast of Seattle, Washington; and 125 mi (200 km) southwest of Spokane, Washington. Operations are permitted under RAEL-005 to perform radiological activities with potential air emissions.

The area south and east of the PNNL-Richland campus is developed with office, laboratory, residential, and retail space. The Columbia River borders the northern campus to the east. Environmental conditions of non-operational Hanford Site areas are also characteristic of the campus. More in-depth discussions on the characteristics of the Hanford Site are available in the Hanford Site National Environmental Policy Act characterization (Duncan et al. 2007).

1.1.1 Historical Background

In December 2003, DOE assigned responsibility to the Pacific Northwest Site Office within DOE-SC to oversee the operation of PNNL, which was established in 1965. Battelle is contracted to DOE to operate PNNL (contract DE-AC06-76RL01830) and has operated PNNL since 1965. The PNNL-Richland campus (orange boundary) includes active emission units in the Physical Sciences Facility (PSF), as identified in Figure 1.1.

Figure 1.1. DOE-SC PNNL-Richland Campus Emission Units Locations

Figure 1.2. Location of the Hanford Site in Relation to the PNNL-Richland Campus

The buildings or areas with emission units subject to 40 CFR 61, Subpart H, reporting are listed in Table 1.1. As a group of research buildings, the PSF buildings host changing types of research. Section 1.2.2 provides more detailed descriptions of the buildings with emission units subject to 40 CFR 61, Subpart H (2002), reporting.

Table 1.1. PNNL-Richland Campus Licensed Buildings – 2023

Building	Start Date of DOE-SC Radiological Operations
3410 Building – Materials Sciences and Technology Laboratory	August 2010
3420 Building – Radiation Detection Laboratory	August 2010
3425 Building – Underground Laboratory	October 2010
3430 Building – Ultra-Trace Laboratory	July 2010

The Hanford Site history is briefly described here because of its location adjacent to the PNNL-Richland campus and because it is a source of radiological airborne emissions. From the mid-1940s, facilities at the Hanford Site were dedicated to producing plutonium for national defense and to managing the radioactive and chemical wastes generated from those production processes. More recently, major efforts have been underway to clean up contamination in the environment and facilities resulting from past operational practices and the research and development of new and improved waste disposal technologies. The Hanford Site 300 Area, which is closest to the PNNL-Richland campus, contains research and development laboratories and ongoing remediation operations. The two principal DOE Offices that manage programs at the Hanford Site are the Richland Operations Office and the Office of River Protection; the Pacific Northwest Site Office manages PNNL, which operates several Hanford Site 300 Area locations with radiological operations.

1.1.2 PNNL-Richland Campus Facilities

Point source emission units are identified as major or minor. Other emissions are identified as a fugitive emission. The identifier for the emission unit considers whether radiological emissions are expected to expose a member of the public to a potential dose greater or less than 0.1 millirem per year (mrem/yr). A point source is designated *major* when hypothetically, in the absence of all abatement-control equipment, its potential maximum emissions can cause a dose greater than 0.1 mrem/yr (0.001 mSv/yr) EDE¹ to the nearest member of the public not employed by DOE or its contractors associated with the PNNL-Richland campus and who lives near and/or has unrestricted access to a place of employment on the campus. A point source is *minor* when under the same conditions its potential maximum emissions in the absence of all abatement-control equipment cannot cause a dose greater than 0.1 mrem/yr EDE. A source could be characterized as a fugitive emission if a potential source of radioactive material is not actively monitored or ventilated at the point of release.² Fugitive sources of radionuclide emissions are generally those that are not actively ventilated, not sealed to prevent the escape of volatile or resuspended radioactive material to the ambient air, and not as amenable to controlled routine sampling, as is done with stacks. Potential unabated emissions from campus fugitive source locations would be expected to have an extremely small dose impact, even under worst-case release conditions.

Activity and dose information is generally reported to two significant digits. An annual dose rate of less than 1.0E-04 mrem/yr (1.0E-06 mSv/yr) is very low and may be rounded to one significant digit (e.g., 3.9E-05 mrem would be rounded to 4E-05 mrem [4E-07mSv]). More significant digits may be reported if they provide informative resolution or if the value is significantly larger than most of the other values reported with it (e.g., a 5.9723E+01 Ci K-40

¹ CAP88-PC Version 4.0, used for dose modeling, indicates dose as mrem/yr EDE in output files.

² Section 4.0 provides a more detailed discussion of fugitive emissions.

emission from one source and $2.4\text{E-}03$ Ci K-40 emission from another). Reported totals may be slightly different from the sum of individual values in the text because the individual text values are rounded whereas the reported total uses additional, unreported, significant digits in the summed individual value.

Types of emission units under the license include both major and minor emission units as well as fugitive emissions. Fugitive emissions also include Potential Impact Category (PIC)-5 permits for campus-wide operations (Table 1.2; Figure 1.3 and Figure 1.1). PIC-5 emissions are very low potential-to-emit activities that are permitted under the license and conform to PNNL operational controls; emissions are conservatively reported as the permit maximum (Barnett 2018).

Table 1.2. Types of Emission Units under the DOE PNNL-Richland Campus License – 2023

Facility/Building ID	Building Name or Campus-wide Permit Name	Emission Unit Type(s)
PSF/ 3410	Materials Sciences and Technology Laboratory	Major
PSF/ 3420	Radiation Detection Laboratory	Major and Minor
PSF/ 3425	Underground Laboratory	Fugitive
PSF/ 3430	Ultra-Trace Laboratory	Major and Minor
Campus	Volumetrically Released Radioactive Material (VRRM; PIC-5)	Fugitive
	Non-dispersible Radioactive Material (NDRM; PIC-5)	Fugitive
	Facilities Restoration (PIC-5)	Fugitive
	Sources for Instrument/Operational Checks (SIOC; PIC-5) ^(a)	Fugitive

(a) Name reflects RAEL-005 nomenclature; historically referred to as Low-level Sources (LLS) PIC-5 emission unit.

Figure 1.3. PNNL-Richland Campus Physical Sciences Facility (PSF) with Buildings Identified

1.1.3 Facilities Adjacent to the PNNL-Richland Campus

Developed land adjacent to the PNNL-Richland campus is occupied by the Hanford Site (Figure 1.2), office and research facilities, and a smaller number of local businesses (e.g., restaurant, offices). Just north of the campus, the Hanford Site 300 Area hosts radiological operations. The current Hanford Site 300 Area activities include cleanup, research, and office support functions. Radiological emissions from the Hanford Site are described in the Hanford Site Radionuclide Air Emissions Report (Dyekman et al. 2024).

In addition to the Hanford Site, some privately and publicly owned facilities capable of generating airborne radionuclide emissions are located adjacent to or near the PNNL-Richland campus. These facilities include those that are on the Hanford Site but are not part of DOE operations: 1) a low-level waste burial site on the Hanford Site 200 Area plateau and 2) a commercial nuclear power reactor and associated buildings near the Columbia River, north of the Hanford Site 300 Area. In addition, nearby facilities include a tritium radiolabeling service south of the campus, a commercial nuclear reactor fuel fabrication facility, and a waste treatment business west of the campus, and a nuclear power plant commercial laundry service southwest of the campus. These facilities are discussed in this report to the extent necessary. Emissions from these facilities are not included in this report because they are regulated separately from the campus.

1.2 Point Source Descriptions

This section describes point sources that emit or have the potential to emit radionuclides at the PNNL-Richland campus. A point source is reported in this document if it met the following two criteria during 2023:

- Required continuous sampling or periodic confirmatory measurements (including 40 CFR 61, Appendix D calculations) in accordance with 40 CFR 61, Subpart H, and with WAC 246-247.
- Was described in the WDOH-issued RAEL-005 and remained a registered emission unit during 2023.

Table 1.3 lists the campus emission units registered with the WDOH for radiological emissions. During 2023, the EP-3430-01-S emission unit was modified to a three-fan system with an air blender to expand the exhaust capacity for the 3430 Building labs to accommodate ongoing and future research. Potential Impact Categories for each emission unit are provided (Barnett 2018).

Table 1.3. PNNL-Richland Campus Registered Radioactive Air Emissions Units

Building	Discharge Point ID	Discharge Point Description	Compliance Method^(a)
3410	EP-3410-01-S	Major point source. Main stack. PIC-2.	Continuous sampling, Appendix D
3420	EP-3420-01-S	Major point source. Main stack. PIC-2.	Continuous sampling, Appendix D
	EP-3420-02-S	Minor point source. Areas not exhausted to main stack. Calculations used to determine radionuclide emissions in lieu of monitoring. PIC-4.	Appendix D
3425	J-3425	Fugitive emissions. Calculations used to determine radionuclide emissions in lieu of monitoring. PIC-4.	Appendix D
3430	EP-3430-01-S	Major point source. Main stack. PIC-2.	Continuous sampling, Appendix D
	EP-3430-02-S	Minor point source. Areas not exhausted to main stack. Calculations used to determine radionuclide emissions in lieu of monitoring. PIC-4.	Appendix D
Campus	J-VRRM	Volumetrically released radioactive material	PIC-5
	J-NDRM	Non-dispersible radioactive material	PIC-5
	J-Facilities Restoration	Facilities restoration	PIC-5
	J-SIOC	Sources for instrument/operational checks	PIC-5

(a) Appendix D means that values are calculated from in-facility material inventories and estimates and 40 CFR 61, Appendix D (1989). PIC-5 source compliance indicated per permit methods during years that the source is used.

1.2.1 Emission Point Characteristics

In general, radionuclide air emissions from point sources are discharged from stacks and vents. Table 1.4 provides the emission point characteristics for the sampled emission units. The effective discharge height of 3410-01-S used in modeling was 108 ft (32.8 m) and was applied to all PSF major stack emissions, as a conservative assumption. Neither the J-Facilities Restoration nor J-SIOC PIC-5 permits were implemented in 2022.

High-efficiency particulate air (HEPA) filters were the principal emission abatement method used at the major emission units to remove radioactive constituents from stack emissions. In general, one-stage of HEPA filtration was used as the final particulate-removal method before an air emission stream was exhausted to the atmosphere. (Table 1.4 lists the emission abatement technologies at sampled stacks.) The single-stage HEPA filter abatement technology listed in the table has a minimum acceptable test criteria rating of 99% efficient.

Table 1.4. Characteristics of Sampled Emission Points

Unit Type/ Emission Point ID	Average Flow Rate	Total Flow	Temper- ature	Physical Discharge Height	Physical Discharge Diameter	Effective Discharge Height	Abatement Technology
Major EP-3410-01-S	22,360 ft ³ /min (10.6 m ³ /s)	1.17E+10 ft ³ (3.31E+08 m ³)	77.7 °F (25.4 °C)	44 ft (13.5 m)	3.3 ft (1.0 m)	108 ft (32.8 m)	Single- stage HEPA filter
Major EP-3420-01-S	63,820 ft ³ /min (30.1 m ³ /s)	3.35E+10 ft ³ (9.49E+08 m ³)	64.1 °F (17.8 °C)	51 ft (15.5 m)	4.3 ft (1.3 m)	145 ft (44.1 m)	Single- stage HEPA filter
Major EP-3430-01-S	33,260 ft ³ /min (15.7 m ³ /s)	1.75E+10 ft ³ (4.96E+08 m ³)	59.7 °F (15.4 °C)	53 ft (16.2 m)	3.8 ft (1.2 m)	114 ft (34.8 m)	Single- stage HEPA filter

1.2.2 PNNL-Richland Campus Radiological Operations

This section describes the handling and processing of radioactive material in each facility on the PNNL-Richland campus.

Physical Sciences Facility Buildings

3410 Building – Materials Sciences and Technology Laboratory

The 3410 Building provides laboratory space and infrastructure for research associated with performance and life of materials in high-temperature, high-radiation, and corrosive environments found in next-generation technologies and applications for energy, construction, and transportation. Researchers work with metals, ceramics, polymeric materials, composites, and specialized coatings, and surface treatments to study these situations. Radioactive material emissions are discharged from this building through a major stack.

3420 Building – Radiation Detection Laboratory

The 3420 Building contains laboratories for a wide variety of radionuclide measurements. Projects support research in radionuclide measurement technologies, and capabilities used or under development include state-of-the-art analytical chemistry, radiation physics, light detection, particle detection, chromatography, scintillation materials, sorbents/“smart” materials, and field-deployable instrumentation. Applications for these capabilities range from fundamental science to applied systems. Radioactive material emissions are discharged from this building through either the major stack or the minor stack.

3425 Building – Underground Laboratory (Deep Lab)

The 3425 Building is an underground laboratory protected from background radiation to support the radiation detection capabilities in the 3420 Building. Research areas are located 40 ft (12 m) below ground. Projects support the development and advancement of radiation detection technologies. Additional activities include radiation physics experiments, development of ultra-low radioactivity materials, and other fundamental sciences studies. Radioactive material emissions from this building are fugitive emissions.

3430 Building – Ultra-Trace Laboratory

The 3430 Building provides ultra-trace radioanalytical capabilities for nuclear forensics. These capabilities include highly sensitive analytical systems such as mass spectrometers, optical microscopes, and electron microscopes to provide isotopic analyses and ultra-low-level radionuclide detection in a wide variety of sample matrices. Radioactive material emissions are discharged from this building through either the major stack or a minor stack

2.0 Radionuclide Air Emissions

This section presents information on quantities of radionuclide emissions on the PNNL-Richland campus. The sampled point sources listed are actively ventilated stacks using electrically powered exhausters and from which emissions are discharged under controlled conditions. Also included are minor and fugitive emission units.

Three tables are provided to indicate emissions from campus sources:

- Table 2.1 indicates emissions from sampled point sources on the campus in 2023.
- Minor point and fugitive source emissions are shown in two tables
 - Table 2.2 shows the emissions that resulted in 99.8% of the dose impact from minor and fugitive emission units, whereas
 - Table 2.3 shows the remaining 0.2%.

Table 2.4 summarizes the nuclide emissions from major sources and from minor, and fugitive sources that result in more than 99.8% of the total dose impact to the MEI. Appendix B lists the radioactive materials handled or potentially handled at the PNNL-Richland campus in 2023.

Table 2.1. Campus Radionuclide Emissions (Ci) from Sampled Point Sources in 2023

Nuclide	EP-3410-01-S 3410 Building	EP-3420-01-S 3420 Building	EP-3430-01-S 3430 Building	Total (Ci)

(a) Nuclides that contribute 99.8% of the minor and fugitive dose to the MEI. See Table 2.3 for the nuclides that contribute the remaining 0.2% of dose impact.

(b) Maximum of the biweekly or semi-annual average measurement. Gross α is assumed to be Pu-239 and gross β is assumed to be Cs-137 for dose assessment.

(c) Value based on release records.

3.0 Dose Assessment

This section presents the method for determining the MEI dose from PNNL-Richland campus radiological emissions.

3.1 Description of Dose Model and Receptor Evaluation

The dose to the MEI was calculated using the dose-modeling program Clean Air Act Assessment Package 1988-Personal Computer (CAP88-PC) Version 4.0 (EPA 2015), approved by the U.S. Environmental Protection Agency. This dose value was used to determine compliance of the PNNL-Richland campus with the dose standard of 10 mrem/yr EDE to any member of the public as required by 40 CFR 61, Subpart H (2002), and WAC 246-247 (2021).

CAP88-PC Version 4.0 is an environmental dispersion model that allows user-entered emission point characteristics, annual emissions, site-specific meteorology, and public exposure characteristics to be used to calculate the dose to an exposed individual. This model is used to determine the dose to the MEI from campus radionuclide emissions (Table 2.4).

The nearest location (e.g., dwelling, business, school, office) to the PNNL-Richland campus where a public receptor has the potential to receive the maximum exposure from RAEI-005 permitted emission units is determined. This may be a hypothetical person, but there must be some potential for continued occupancy at the location indicated. For example, the campus northwest fence-line was not considered because no individual routinely occupies this location, which is in a shrub-steppe field. In addition to the nearest location, the location with the potential for the greatest annual impact from emissions is determined. Due to the proximity of offsite businesses and the annual variability of dispersion estimates at close distances, several options for businesses at boundary locations are the likely maximally impacted locations based on past evaluations. Table 3.1 indicates the location of the 2023 MEI and provides information on these nearest receptors, including distances to the nearest farms that produce milk, meat, and vegetables.

The PNNL-Richland campus MEI is a member of the public who hypothetically receives the highest calculated radiological dose attributable to exposure to campus emissions in one calendar year. Selection of the annual MEI is contingent on an individual's place of residence or employment.

Potential MEI locations are evaluated with 1) the CAP88-PC Version 4.0 model; 2) PNNL-Richland campus facility emissions and release point characterization; and 3) CY2023 meteorological data (Appendix A) to determine the 2023 MEI receptor location from campus emissions. The receptor is presumed to produce their own food supply at the MEI location.

The CY2023 MEI location was determined to be an office building at 3170 George Washington Way.

Table 3.1. Receptor Locations for the PNNL-Richland Campus

Locale	Distance Relative to PSF (3410 Building) km (mi)
2023 PNNL-Richland Campus MEI	
Office, 3170 George Washington Way	0.74 (0.46) SSE
Offsite nearest residence, business, school

Business ^(a)	0.63 (0.39) SSE
Farm with potential for crops or livestock	
Nearest to PSF (east of Columbia River)	1.51 (0.93) E
Offsite MEI maximum annual air concentrations	
Office, Sigma IV Building, 3170 George Washington Way	
From major emission units ^(b)	0.74 (0.46) SSE of 3410-01-S
From minor and fugitive emission units ^(b)	0.84 (0.52) SSE of 3420-02-S
Richland Campus Historical MEI Doses and Locations^(c)	
CY2022/ 2.3E-05 mrem	0.63 (0.39) SSE
CY2021/ 1.8E-05 mrem	0.64 (0.40) SSE
CY2020 / 1.7E-05 mrem	0.55 (0.34) SSE
CY2019 / 1.5E-05 mrem	0.67 (0.42) SSE
CY2018 / 1.8E-05 mrem	0.64 (0.40) SSE
CY2017 / 2.3E-05 mrem	0.70 (0.43) SSE
CY2016 / 5.8E-04 mrem	1.86 (1.16) S
CY2015 / 2.6E-04 mrem	1.86 (1.16) S
CY2014 / 2.8E-05 mrem	0.70 (0.43) SSE
CY2013 / 1.8E-05 mrem	0.75 (0.47) SSE
CY2012 / 9.2E-06 mrem	0.55 (0.34) SSE
CY2011 / 1.7E-05 mrem	0.55 (0.34) SSE
(a) Locations with PNNL access control are considered part of the PNNL-Richland campus. (b) This location is 2.31 km south of the Hanford Site 300 Area. Minor and fugitive emission unit distances are relative to 3420 Building because the 3410 Building has no minor or fugitive emission points. (c) To convert mrem to mSv, multiply mrem by 0.01. Dose includes point, non-point, and radon emissions.	

3.2 Summary of Input Parameters

Radionuclide emissions data from the PNNL-Richland campus (Table 2.4) were used in the dose calculations. Emissions were modeled in CAP88-PC Version 4.0 with 2023 meteorology and applicable stack characteristics given in Section 1.2.1. The greatest dose impact from facility emissions is calculated for 3170 George Washington Way, SSE of the 3410 Building, where an office is located; as a result, this is the 2023 MEI location. PSF emissions reported as gross alpha or gross beta were conservatively evaluated as Pu-239 or Cs-137, respectively. Appendix A provides additional data used for dose calculations; all other radionuclide-specific parameters used were default values in CAP88-PC Version 4.0 data libraries. The entire hypothetical MEI diet was constructed using the “local” food production option in CAP88-PC for ingestion-pathway parameters. This assumption overestimates the dose to the MEI because no food is grown at the 2023 MEI location.

Figure 3.1. Locations of PNNL-Richland Campus Potential Receptors and MEI

3.3 Meteorological Data

Radionuclide air emissions disperse once they enter the atmosphere. Atmospheric dispersion models predict the degree of dilution and the magnitude of resulting air concentrations at downwind locations. Site-specific measurements of the occurrence frequencies for wind speed, wind direction, and atmospheric stability are used in the CAP88-PC model.

Radionuclide air concentrations at receptor locations are determined using the site-specific meteorological data. CAP88-PC Version 4.0 wind files were prepared from data collected at the Hanford Site 300 Area meteorological tower, just north of the PNNL-Richland campus (refer to

Figure 5.1), representing the average of hourly data recorded in 2023. Appendix A tables indicate meteorological data for 2023 as joint frequency of wind speed, wind direction, and stability category for the Hanford Site 300 Area station, 10 m instrumentation height. The proximity of the 300 Area meteorological station (less than 500 m from the campus boundary) and lack of turbulent interference allows that station data to be used to represent the PNNL-Richland campus meteorology.

Some adjustments to the 2023 meteorological data were necessary. Temperature data used for stability category determinations were substituted for all of 2023. Typically, 10 m and 61 m temperature instrumentation are used in the determinations. The 61 m results were replaced with 76 m results, as sufficient replacements. Additionally, there were several instances of wind instrumentation inoperability (0 wind speed and 0 degrees direction results). During these instances, which mainly happened during an icing event in late November, wind results from Prosser Barricade (station 1) were substituted.

3.4 Compliance Assessment

Federal and state reporting requirements for doses (summarized in Table 3.2) vary. Section 3.4.1 and Section 3.4.2 give details on doses reported under 40 CFR 61, Subpart H, and the WAC, respectively.

Table 3.2. Summary of Reported 2023 Doses

Total dose may not equal the sum of parts due to rounding.

To convert Ci to GBq, multiply Ci by 37. To convert mrem to mSv, multiply mrem by 0.01.

(a) Dose from routine major and minor points' emissions, fugitive emissions, PIC-5, and nonroutine events.

(b) WAC 173-480. See Figure 5.1 for PNL-1 ambient air surveillance station location.

3.4.1 40 CFR 61, Subpart H, Regulatory Standard

The regulatory standard for a maximum dose to any member of the public is 10 mrem/yr (0.10 mSv/yr) EDE. The standard is in 40 CFR 61, Subpart H (2002), and applies to radionuclide air emissions, other than radon, from DOE facilities. For CY2023, the PNNL-Richland campus MEI location was 0.74 km (0.46 mi) SSE of the 3410 Building. The campus MEI dose is 2.0E-05 mrem (2.0E-07 mSv) (see Table 3.2, 40 CFR 61, Subpart H).

Table 3.3 indicates nuclide-specific doses to the CY2023 campus MEI. The MEI dose includes routine and, as applicable, unplanned (i.e., nonroutine) point source emissions (see Section 3.5.4). The fugitive PIC-5 category doses are about 9% of the CY2023 campus MEI dose estimate.

(a) Release in whole or in part based on 40 CFR 61, Appendix D (1989), release records, or measurements. See Table 2.1 and Table 2.2.

(b) Gross alpha from PSF emission unit sampling assumed to be Pu-239 for dose modeling.

(c) Gross beta from PSF emission unit sampling assumed to be Cs-137 for dose modeling.

(d) The PIC-5 emission doses are assigned based on permit value. The SIOC emission sources were not implemented in 2023. The SIOC PIC-5 permit has been alternatively referred to as the LLS PIC-5 permit.

(e) Totals may not add up to value indicated due to rounding.

Table 3.4 provides the campus MEI dose attributed to each emission point. The doses assigned to the fugitive VRRM, NDRM, and Facility Restoration PIC-5 permitted emissions indicate a maximum dose impact. The PIC-5 permitted emissions for J-SIOC were not applicable for 2023 operations. All respective dose estimates were below the abated emission dose limit of each emission unit.

Campus-wide					
Campus	J-VRRM	9.4E-07 mrem	PIC-5	9.4E-07 ^(d)	5%
Campus	J-NDRM	6.6E-08 mrem	PIC-5	6.6E-08 ^(d)	<1%
Campus	J-Facilities Restoration	8.4E-07 mrem	PIC-5	8.4E-07 ^(d)	4%
Campus	J-SIOC	1.0E-06 mrem	PIC-5	0 ^(b)	0%

To convert mrem to mSv, multiply mrem by 0.01.

(a) RAEL-005 abated emission dose limit for each emission unit.

(b) Emissions “estimated” are determined by 40 CFR 61, Appendix D, and may include gas emissions from release records.

(c) Subpart H dose values do not include radon. Radon contributes an additional 4.0E-7 mrem (3410-01-S) and 4.0E-10 mrem (3420-02-S) under WAC 246-247.

(d) Dose assigned by permit determination, or for J-SIOC a dose estimate may be done.

For comparison, the Subpart H PNNL-Richland campus 2023 MEI dose and average U.S. background radiation (NCRP 2009) are shown below:

• Annual natural background radiation	310.0	mrem/yr
• Daily natural background radiation	0.85	mrem/d
• Hourly natural background radiation	0.035	mrem/hr
• Per minute natural background radiation	0.00059	mrem/min
• PNNL-Richland campus 2023 MEI dose (40 CFR 61, Subpart H)	0.000020	mrem/yr
• Per second natural background radiation	0.0000098	mrem/sec

Dose from anthropogenic sources, overwhelmingly a result of medical procedure exposures, adds another 310 mrem (3.1 mSv) to the annual average U.S. dose (HPS 2012). Last year, the campus MEI dose was 2.3E-05 mrem/yr (2.3E-07 mSv/yr).

3.4.2 Washington Administrative Code

For PNNL-Richland campus radionuclide air emissions, Washington State in WAC 246-247-040(1) has adopted the federal dose standard of 10 mrem/yr found in 40 CFR 61, Subpart H (2002). In addition to the maximum dose attributable to radionuclides emitted from point sources, WAC 246-247-040(6) requires that the dose to the MEI also include doses attributable to fugitive emissions, radon, and nonroutine events. Radon is exempt from consideration in determining compliance with the dose standard of 40 CFR 61, Subpart H, but it is encompassed by state regulations, as in WAC-246-247-040(6), which states that “[a]ll emissions of radionuclides . . . are subject to the standards of this section.”

The WAC 246-247 receptor location considers whether an individual resides or abides at the evaluated location (see Table 3.2, WAC 246-247). For 2023, the WAC-246-247 dose is the $2.1\text{E-}05$ mrem/yr ($2.1\text{E-}07$ mSv/yr). An additional assessment was performed for the location with maximum offsite nuclide air concentrations, whether the reside/abide criterion was met or not (see Table 3.2, WAC 173-480). For CY2023, the maximum modeled air concentration is the same as the MEI location, this WAC 173-480 dose is $2.1\text{E-}05$ mrem/yr ($2.1\text{E-}07$ mSv/yr).

3.4.3 PNNL-Richland Campus and Hanford Site Subpart H Doses

For information purposes only, the nearby Hanford Site, which is the adjacent DOE site with major emissions units, was considered for comparative evaluation. PNNL-Richland campus air compliance is a distinctly separate issue, but the dose from such nearby major radiological emitters is worth considering for total DOE-source impacts to the region. Hanford Site 300 Area emissions and the Hanford Site MEI for CY2023 were reviewed. Both the PNNL-Richland campus and the Hanford Site (Dyckman et al. 2024) are in compliance with the 10 mrem/yr regulatory standard for CY2023 radiological emissions.

The CY2023 Hanford Site MEI location is on the PNNL-Richland campus, directly south of the Hanford Site 300 Area. As a result, no dose to the Hanford Site MEI from campus emissions was estimated for 2023. The dose to both the PNNL-Richland campus MEI and the Hanford Site MEI from the Hanford Site 300 Area emissions in 2023, excluding Rn-220 and Rn-222 (see Dyckman et al. 2023), is indicated in Table 3.5. Essentially all of the dose from Hanford Site 300 Area emissions to the campus MEI (and Hanford Site MEI) is attributable to H-3 releases.

Table 3.5. Subpart H Doses to PNNL-Richland Campus MEI and Hanford Site MEI

Receptor	Dose from 2023 PNNL-Richland Campus Emissions	Dose from 2023 Hanford Site 300 Area Emissions
Hanford Site 2023 MEI	NA ^(a)	5.2E-02 mrem
PNNL-Richland campus 2023 MEI	2.0E-05 mrem	4.6E-02 mrem

NA = not applicable.
 To convert mrem to mSv, multiply mrem by 0.01.
 (a) Hanford Site receptor is located at the PNNL-Richland campus.

3.5 Additional Compliance Information

3.5.1 Applicability of Stack Emissions Data to Air Emission Permits and Licenses

The WDOH license (RAEL-005) requires that an environmental monitoring program be established for the PNNL-Richland campus as a condition of operation. Environmental monitoring supplements the required stack sampling and provides additional assurance that airborne radiological releases comply with federal and state standards. The requirements for site selection and sampling program optimization are documented in Snyder et al. 2024. There are currently five particulate ambient air sampling stations. The campus Environmental Monitoring Plan is documented in Snyder et al. 2020.

3.5.2 Approvals to Construct or Modify

No approvals under 40 CFR 61.96 were requested or granted in 2023.

3.5.3 Radon-220 and Radon-222 Emissions

Both radon-220 and radon-222 were emitted from PNNL-Richland campus operations in 2023. See Section 3.4 for radon emissions and dose results.

3.5.4 Unplanned Releases of Radionuclides to the Atmosphere

No unplanned releases were reported in 2023.

4.0 Fugitive Sources of Emissions

The Clean Air Act (i.e., 40 CFR 61, Subpart H) governs emissions of radionuclides from DOE facilities and the resulting radiological doses to members of the public. A dose standard of 10 mrem/yr EDE was implemented, to which compliance is expected for radionuclide emissions emanating from both point and fugitive sources. Measuring and/or modeling these emissions are fundamental to demonstrating compliance with the standard.

In general, fugitive sources of radioactive emissions are radionuclide air emissions that do not and could not reasonably pass through a stack, vent, or other functionally equivalent structure and that are not feasible to measure directly or quantify (WAC 246-247-030). Some fugitive sources can be classified as diffuse (i.e., area) sources (DOE 2022). The PNNL-Richland campus has no diffuse sources.

PNNL facility-specific fugitive sources include only J-3425 in 2023. In addition to facility-specific fugitive sources, campus-wide permits for fugitive emissions are registered with WDOH. These include the following:

- J-VRRM Volumetrically released radioactive material
- J-NDRM Non-dispersible radioactive material
- J-Facilities Restoration Facilities restoration
- J-SIOC Sources for instrument/operational checks

These four permitted fugitive emissions sources are managed such that the assigned dose (see Table 3.3) over-estimates the actual dose from respective applicable campus-wide releases. These permits include PIC-5 (Barnett 2018) levels of radionuclide emissions and cover a broad range of the nuclides, as listed in Appendix B.

The 2023 PNNL-Richland campus emissions from facility fugitive sources were estimated (see Table 2.2 for a list of dose-significant emissions) and dose was determined (see Table 3.4). Table 3.4 also indicates the relative magnitudes and the permit-assigned doses from campus-wide fugitive emission sources. Fugitive emissions from facility and permitted fugitive emissions account for $1.9\text{E-}06$ mrem/yr ($1.9\text{E-}08$ mSv/yr), which is about 9% of the total MEI dose for 2023.

Emissions from fugitive sources mix with ambient air, which may also include emissions from point sources. Emissions from all PNNL-Richland campus sources *and* non-PNNL and background sources are monitored by five particulate air sampling stations. The air surveillance program conducted in 2023 is described in Section 5.3.

Past operations at the nearby Hanford Site created a number of fugitive sources within the landscape, whose emissions could affect the PNNL-Richland campus. The Hanford Site fugitive emissions are evaluated in detail in their Radiological Air Emissions Report (e.g., Dyekman et al. 2024).

5.0 Supplemental Information

This section provides the following supplemental information related to PNNL-Richland campus radionuclide air emissions in 2023:

- Collective dose estimate (DOE 1995)
- Compliance status with 40 CFR 61, Subparts Q (2000) and T (2000)
- Radionuclide emission estimates and periodic confirmatory measurement information related to notices of construction
- Ambient air sampling measurements
- Quality assurance (QA) program status of compliance with 40 CFR 61, Appendix B (2011), Method 114

5.1 Collective Dose Estimate

The estimated regional collective dose from PNNL-Richland campus air emissions in 2023 was calculated using CAP88-PC Version 4.0. Regional populations were based on 2020 U.S. Census data within a 50-mile (80-km) radius of the campus (Rose et al. 2023). Pathways evaluated for population exposure include inhalation, air submersion, ground shine, and food consumption. CAP88-PC Version 4.0 calculates the collective dose by considering site-specific meteorology and population distributions, and subsequently summing the individual sector doses.

The 2023 total collective dose from radionuclide air emissions estimated from nuclides that originated from the PNNL-Richland campus was 2.4E-4 person-rem (2.4E-6 person-Sv). This represents a slight decrease from the 2022 estimate of 2.5E-4 person-rem (2.5E-6 person-Sv) (Snyder et al. 2023).

5.2 Compliance Status with 40 CFR, Subparts Q and T

In 40 CFR 61, Subpart Q (2000), “National Emission Standards for Radon Emissions From Department of Energy Facilities,” paragraph 61.190 states that the Subpart Q provisions apply to the design and operation of all storage and disposal facilities for radium-bearing material that emits Rn-222 to the air. Paragraph 61.191(b) states that a source means any building, structure, pile, impoundment, or area used for interim storage or disposal that is or contains waste material containing radium in sufficient concentration to emit Rn-222 in excess of a standard of 20 pCi/m²/s. No operations from the storage and disposal of radium-bearing material resulting in radon emissions are conducted on the PNNL-Richland campus.

Activities at the campus were evaluated for compliance with 40 CFR 61, Subpart T (2000), “National Emissions Standards for Radon Emissions from the Disposal of Uranium Mill Tailings.” In paragraph 61.220, “Designation of Facilities,” owners and operators of such facilities are subject to the provisions in Subpart T: those whose sites were used for the disposal of tailings and that managed residual radioactive material or uranium byproduct materials during and following the processing of uranium ores and that are listed in or designated by the Secretary of Energy under Title I of the Uranium Mill Tailings Control Act of 1978 or regulated under Title II of

that act. No uranium milling and uranium ore processing activities are conducted on the PNNL-Richland campus.

Subparts Q and T do not apply to the PNNL-Richland campus for CY2023 operations.

5.3 Environmental Surveillance for the PNNL-Richland Campus

Environmental surveillance activities for the PNNL-Richland campus radionuclide emissions sources include ambient particulate air sampling and ambient external dose monitoring. Data for environmental surveillance sample planning, collection, tracking, and reporting are managed by the cloud-based Environmental Information Management (EIM)¹ software system.

5.3.1 Ambient Air Surveillance

Under the requirements of WDOH license (RAEL-005), the PNNL-Richland campus must operate and maintain a radiological air monitoring program. The requirements for site selection and sampling program optimization are documented in Snyder et al. 2024. A particulate air sampling network was established in 2010 to monitor radioactive particulates in ambient air near the campus. This sampling was initiated before starting radiological operations at the new PSF buildings. The first full calendar year of air surveillance was 2011. To satisfy air permit requirements, samples were collected in 2023 at four ambient air sampling stations within and along the perimeter of the PNNL-Richland campus and at a background monitoring station that was established in Benton City, Washington (Figure 5.1). In addition to campus emissions, these samplers can collect radioactive particulates released from other nearby sources. During 2023, the Hanford Site 300 Area would have contributed most of the non-PNNL particulates detected from offsite facilities.

Routine surveillance activities at the PNNL-Richland campus include air sampling for particulate radionuclides. The air surveillance program is described in Snyder et al. (2020) and attachments (Meier 2011; Bisping 2011; Snyder and Cooley 2024). During 2023, environmental air surveillance continued at PNL-1 (solar), PNL-2 (solar), PNL-3, PNL-4, and PNL-5 (background location) (Figure 5.1). Starting in 2023, the north area of the campus began to undergo development. As documented in Snyder et al. 2024, impacts to and optimization of the existing network of ambient air surveillance stations were evaluated. This will result in planned CY2024 relocations of stations PNL-2 and PNL-3 to accommodate new construction, as well as improved sampling of emission unit effluent in the ambient environment.

Unless conditions warrant otherwise, particulate air samples are routinely collected biweekly (every two weeks) and analyzed for gross alpha activity and gross beta activity. Semi-annually, filters are composited for specific radionuclide analysis. The composite analyses reported for 2023 include gamma-emitting isotopes Co-60 and Cs-137, U-233/234,² Pu-238 and Pu 239/240, Am-241, Am-243, and Cm-243/244.

Offsite events that affected the ambient sampling program in 2023 included numerous wildfires in the Pacific Northwest, which caused continuous smoky days in August and September 2023. During these periods when high levels of particulate matter were trapped beneath a local inversion layer, ambient air sampling stations were evaluated more frequently to ensure air flow

¹ Locus EIM, provided by Locus Technologies, Mountain View, California. <https://locustec.com/>.

² U-234 is a naturally occurring radionuclide. It is co-reported with U-233 by the analytical laboratory because the emission peaks overlap.

to the sampler was maintained. In August 2023, two of the five particulate air sampling stations (solar-powered stations PNL-1 and PNL-2) were collected 2 days earlier than planned as a result of the smoky conditions and also required a weekly instead of biweekly filter change-out through early September 2023 to maintain sampler air flow. On these occasions, the air filters that sampled for one week collected sufficient volume for gross alpha and gross beta analyses. Power outages were planned for PNL-4 for a day in July and a day in September 2023 to accommodate installation of a nearby electric vehicle charging station. There was no significant loss of sample during either of the PNL-4 planned outages. There was no significant impact to the annual composite results or station operational frequency for CY2023, because of these events.

Air sampling results are summarized in Table 5.1. The biweekly gross alpha and gross beta results were comparable to background levels and detectable semi-annual composite values are within the uncertainty of the PNL-5 background values. All nuclide-specific results shown in Table 5.1 were less than the values in Table 2 of 40 CFR 61, Appendix E. There was no indication that levels of monitored particulate radionuclides near the PNNL-Richland campus were above standards. The particulate ambient air sampling results are provided in Appendix C for the CY2023 campus sampling, including composite gross alpha and gross beta results.

Figure 5.1. Air Surveillance Station Locations for the PNNL-Richland Campus

To convert pCi/m³ to Bq/m³, multiply pCi/m³ by 0.037.

(a) Refer to Figure 5.1 for PNL-1, PNL-2, PNL-3, PNL-4, and PNL-5 locations.

(b) The Value is the average of samples collected throughout the year, with no background (PNL-5) results subtracted.

(c) Semiannual composite analyses.

5.3.2 Ambient External Dose Monitoring

Ambient levels of external dose from beta, gamma, and X-ray sources were monitored quarterly at the five particulate air monitoring stations during 2023. No current PNNL-Richland campus radioactive air emissions include significant quantities of external dose contributors. The program establishes baseline ambient external dose levels at the perimeter particulate sampling stations and the background (PNL-5) station. The 2023 ambient external dose monitoring results at campus monitoring stations ranged from 26–29 mrem/yr (0.26–0.29 mSv/yr), and the background station indicated a local ambient external dose of 33 mrem/yr (0.33 mSv/yr). The reported error for the external dosimeters is 12%. Additional details regarding ambient external dose monitoring will be in the next PNNL Site Environmental Report of 2023 operations (e.g., Thompson et al. 2023).

5.4 Quality Assurance Program Compliance Status

Air emissions data reported in this document reflect the product of many QA activities concerned with the collecting, handling, analyzing, validating, and reporting of samples and the resultant analytical data. Those activities are identified in the QA plans (PNNL 2022) and in the PNNL-Richland campus Environmental Radiological Air Monitoring Plan (Snyder et al. 2020). The effluent monitoring QA elements described in PNNL (2022) were compatible with one or more of the documents shown in Table 5.2 during CY2023. QA requirements are implemented, as appropriate, at the campus as new facilities become operational and programmatic plans are developed.

Table A.2. Exposure and Consumption Data for the PNNL-Richland Campus

FOOD SOURCE FOR THE MAXIMALLY EXPOSED INDIVIDUAL
(fraction of food produced at indicated location)

<u>Food</u>	<u>Local</u>	<u>Regional</u>	<u>Imported</u>
Vegetable	1.000	0.000	0.000
Meat	1.000	0.000	0.000
Milk	1.000	0.000	0.000

VALUES FOR RADIONUCLIDE-INDEPENDENT VARIABLES

HUMAN INHALATION RATE (cm^3/hr) = $5.26 \text{ E}+03$

SOIL PARAMETERS

Effective surface density, $\text{kg}/\text{sq m}$, dry weight
(assumes 15-cm plow layer) = $2.15 \text{ E}+02$

BUILDUP TIMES

For activity in soil (yr) = $1.00 \text{ E}+02$
For radionuclides deposited on ground/water (d) = $3.65 \text{ E}+04$

DELAY TIMES

Ingestion of pasture grass by animals (hr) = $0.00 \text{ E}+00$
Ingestion of stored feed by animals (hr) = $2.16 \text{ E}+03$
Ingestion of leafy vegetables by man (hr) = $3.36 \text{ E}+02$
Ingestion of produce by man (hours) = $3.36 \text{ E}+02$
Transport time from animal feed-milk-man (d) = $2.00 \text{ E}+00$
Time from slaughter to consumption (d) = $2.00 \text{ E}+01$

WEATHERING

Removal rate constant for physical loss (per hr) = $2.90 \text{ E}-03$

CROP EXPOSURE DURATION

Pasture grass (hr) = $7.20 \text{ E}+02$
Crops/leafy vegetables (hr) = $1.44 \text{ E}+03$

AGRICULTURAL PRODUCTIVITY

Grass-cow-milk-man pathway (kg/m^2) = $2.80 \text{ E}-01$
Produce/leafy veg for human consumption (kg/m^2) = $7.16 \text{ E}-01$

FALLOUT INTERCEPTION FRACTIONS

Vegetables = $2.00 \text{ E}-01$
Pasture = $5.70 \text{ E}-01$

GRAZING PARAMETERS

Fraction of year animals graze on pasture = $4.00 \text{ E}-01$
Fraction of daily feed that is pasture grass when animal grazes on pasture = $4.30 \text{ E}-01$

ANIMAL FEED CONSUMPTION FACTORS

Contaminated feed/forage (kg/day , dry weight) = $1.56 \text{ E}+01$

DAIRY PRODUCTIVITY

Milk production of cow (L/day) = $1.10 \text{ E}+01$

Table A.2. (contd)

MEAT ANIMAL SLAUGHTER PARAMETERS

Muscle mass of animal at slaughter (kg) = 2.00 E+02

Fraction of herd slaughtered (per day) = 3.81 E-03

DECONTAMINATION

Fraction of radioactivity retained after washing
or leafy vegetables and produce = 5.00 E-01

FRACTIONS GROWN IN GARDEN OF INTEREST

Produce ingested = 1.00 E+0

Leafy vegetables ingested = 1.00 E+00

INGESTION RATIOS:

IMMEDIATE SURROUNDING AREA/TOTAL WITHIN AREA

Vegetables = 1.00 E+00

Meat = 1.00 E+00

Milk = 1.00 E+00

MINIMUM INGESTION FRACTIONS FROM OUTSIDE AREA

(Minimum fractions of food types from outside area listed below are actual fixed values.)

Vegetables = 0.00 E+00

Meat = 0.00 E+00

Milk = 0.00 E+00

HUMAN FOOD UTILIZATION FACTORS

Produce ingestion (kg/yr) = 7.62 E+01

Milk ingestion (L/yr) = 5.30 E+01

Meat ingestion (kg/yr) = 8.40 E+01

Leafy vegetable ingestion (kg/yr) = 7.79 E+00

SWIMMING PARAMETERS

Fraction of time spent swimming = 0.00 E+00

Dilution depth for water (cm) = 1.00 E+00

EXTERNAL DOSE

Ground surface contamination correction factor = 5.00 E-01

Table A.3. PNNL-Richland Campus Meteorological Data — General Information

HEIGHT OF LID

LIDAI = 1,000 m

RAINFALL RATE [2023]

RR = 15.3 cm/yr (6.02 in/yr)

AVERAGE AIR TEMPERATURE [2023]

A = 13.1 degrees C (55.5 degrees F; 286.2 K)

SURFACE ROUGHNESS LENGTH

0 = 0.010 m

VERTICAL TEMPERATURE GRADIENTS: (TG) (K/m)

STABILITY E 0.073

STABILITY F 0.109

STABILITY G 0.146

Appendix B – List of Radioactive Materials Handled or Potentially Handled at the PNNL-Richland Campus in 2023

Appendix C – Ambient Particulate Air Sampling Results for PNNL-Richland Campus Air Surveillance in 2023

Table C.1. Definitions for Air Sampling Data

Column Heading	Data Type/Format	Content
Location ID	Text	Location of monitoring station: <u>PNNL-Richland campus monitoring stations</u> <u>Background Location</u> PNL-1, PNL-2, PNL-3, PNL-4 PNL-5
Field Sample ID	Number (#####)	Unique identifier assigned to a sample (typically six-digit number but characters allowed).
Sample Matrix	Text	Matrix of the sample at the time of sample collection (e.g., FILTER)
Start Date	Date (DD-MMM-YYYY)	Date when air sampling started.
Sample Date	Date (DD-MMM-YYYY)	Date when air sampling ended.
Parameter Name	Text	Code assigned to analytical parameter (e.g., Gross alpha, Cesium-137, Plutonium-238). Note: The sum of Uranium-233 and Uranium-234 is reported as either isotope and used for Uranium-233 reporting.
Result	Number (usually scientific notation)	Result reported by the analytical laboratory.
Units	Text	Picocuries per cubic meter. Units associated with the values shown in the Result, Counting Error, and Total Error columns.
Counting Error	Number (usually scientific notation)	The 2-sigma counting error for the radioanalytical results only.
Total Error	Number (usually scientific notation)	The 2-sigma total analytical error for the radioanalytical results only.
Lab Qualifier	Text or Blank	If "U", the Result was not detected above limiting criteria, which may include any of the following: Result < 0, or < Counting Error, or < Total Error, or <= Contract method detection limit/instrument detection limit/minimum detectable activity/practical quantitation limit. . If "O", the case narrative contains additional information regarding quality control criteria not being met.
Sample Comment	Text or Blank	Additional information pertaining to the sample. If blank, no comment was needed
Result Comment	Text or Blank	Additional information pertaining to the analytical result. If blank, no comment was needed.
Composite	Y or Blank	Composite of two or more samples. If "Y", several samples from the same monitoring station were composited and the composite measured for radioactivity. If blank, a single sample was measured.
Further details on each PNNL-Richland campus sample event (e.g., sample volume, lab method) can be obtained from the project Environmental Information Management (EIM) software system provided by Locus Technologies.
