Hanford Site Regional Population – 2010 Census

EL Hamilton
SF Snyder

August 2011

Prepared for
the U.S. Department of Energy
under Contract DE-AC05-76RL01830

Pacific Northwest National Laboratory
Richland, Washington 99352

Summary

The U.S. Department of Energy (DOE) conducts radiological operations in south-central Washington State. Population dose estimates must be performed to provide a measure of the impact from site radiological releases. Results of the U.S. 2010 Census were used to determine counts and distributions for the residential population located within 50 miles of several operating areas of the Hanford Site. Year 2010 was the first census year that a 50-mile population of a Hanford Site operational area exceeded the half-million mark.

1.0 Introduction

The newly available 2010 U.S. Census data were used to update 50-mile residential population data relative to five major operating areas of the Hanford Site in Washington State. This information updates Elliott et al. (2004), which provided data from the year 2000 Census. The 1990 Census data evaluation was published in Beck et al. (1991). For 2010, the population within 50-miles is provided for a radial grid of 160 segments centered on each of five operating areas. Figure 1.1 indicates the Hanford Site boundary and county borders with the 50-mile grid centered on the 200 Area Hanford Meteorological Station (HMS). Morrow and Umatilla Counties are in Oregon. All other counties are in Washington.

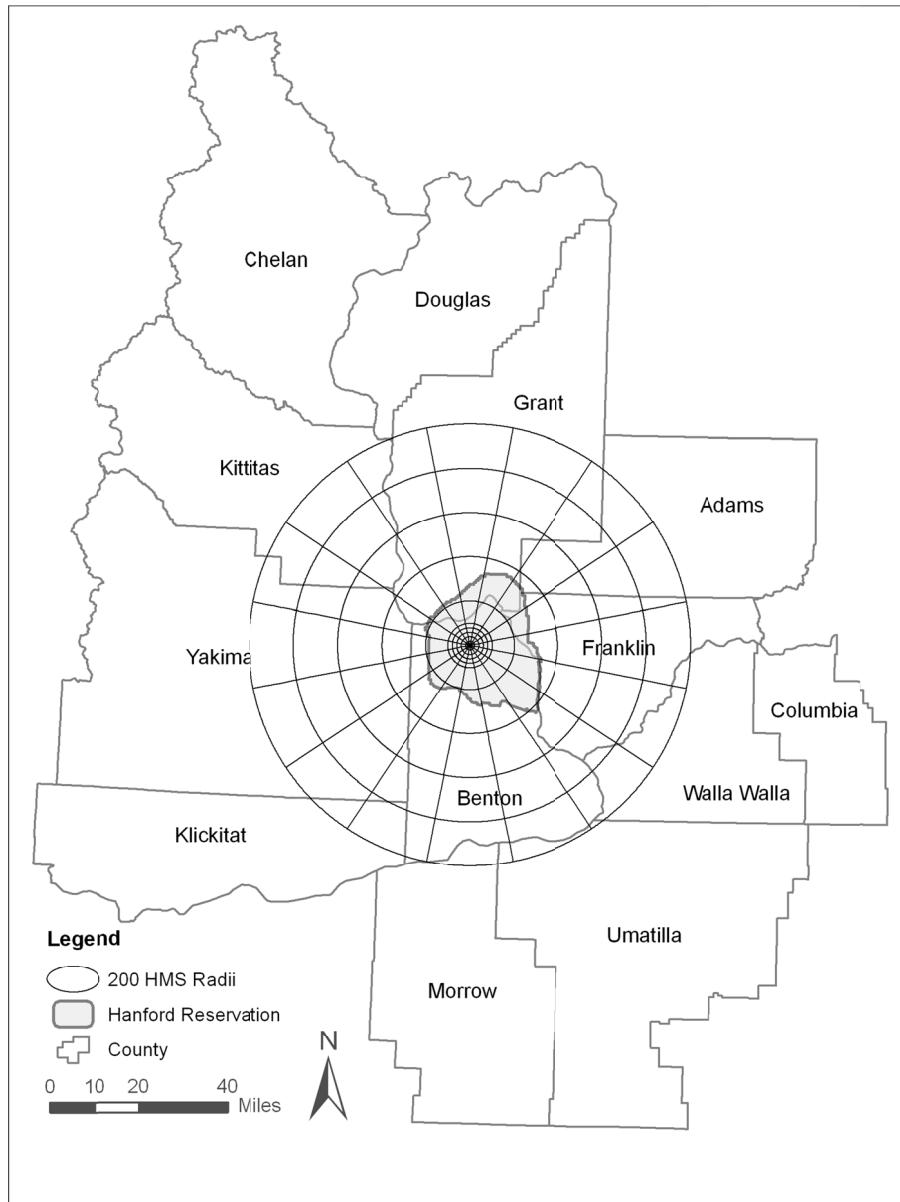

Figure 1.1. 200 HMS 50-mile Region and County Overlay

2.0 Data Evaluation

Geographic information system (GIS) software, ArcInfo 9.3.1 (ESRI 2009), was used to create direction- and distance-specific circular grids centered on each of five Hanford Site locations: 100 K Area, 200 Area Hanford Meteorological Station (HMS) located between the 200-West and 200-East Areas, 300 Area, 400 Area, and the Hanford Tank Waste Treatment and Immobilization Plant (WTP) site located east of the 200-East Area (Table 2.1; Figure 2.1). The grids contained concentric circles with radii of 1, 2, 3, 4, 5, 10, 20, 30, 40, and 50 miles, expanding from the point of one of five Hanford locations. The 16 directional sectors of the grid were created using the four cardinal directions (N, E, S, W), the four ordinal directions (NE, SE, SW, NW), and the eight half-wind directions (NNE, ENE, ESE, SSE, SSW, WSW, WNW, NNW). The 10 concentric distance circles were then combined with the 16 directional sectors to create a circular grid with 160 sections (Figure 2.2 through Figure 2.6).

Table 2.1. Locations of Operating Areas

Operating Area	Longitude	Latitude
100K Area	-119.578	46.657
200 HMS	-119.599	46.563
300 Area	-119.286	46.364
400 Area	-119.360	46.430
WTP	-119.521	46.556

In order to determine the population totals for each circular grid section, Census 2010 Tiger/Line block-level shapefiles containing Census 2010 Redistricting population totals (Census 2010a, 2010b, 2010c) were brought into the GIS. The area was calculated for each block and the population was assumed to be evenly distributed within that area. Then the block-level boundaries were intersected with the circular grids. The area was again calculated for the newly intersected blocks. To calculate a new population for each of the 160 grid segments, the areas for the block portions within a grid were multiplied by their respective original average census block population densities, then summed and rounded to the nearest whole number. For example, if a circular grid section contained 40% of the original area of a block, then it was assumed that the section also contained 40% of the block's original population. This procedure was repeated for grids centered at each location of interest to create the 50-mile (80-km) population distribution based on the 2010 census data. See Figure 2.2 through Figure 2.6 for census block overlays with the 50-mile radial grid.

3.0 Data Graphics and Tables

The data resulting from the evaluation described in Section 2.0 are presented here in graphic and tabular form. The user can then format the population distributions as needed for a particular application. Figure 3.1 through Figure 3.5 indicate the 5-10 mile and additional 10 mile-increment populations in the larger grid, and the 1-mile increment populations in the smaller 0-5 mile inset. Grid directions follow the compass rose with the top center sectors as North. Table 3.1 through Table 3.5 present the data in tabular form.

4.0 Notes on Data Use

The data presented in this report strictly follow the evaluation procedure described, and no additional verification has been performed. The process of averaging populations over the census block area may indicate the presence of a residential individual where none exists, or no individuals where one does exist. In addition, census data may not be complete for some census blocks due to collection issues within the U.S. Census. These are important factors to consider, especially for dose calculations at distances in closer proximity to an emission source.

5.0 Multi-year Population Summary

The 50-mile populations have been evaluated from 1990 (Beck et al. 1991), 2000 (Elliott et al. 2004), and the current 2010 U.S. Census data. Table 5.1 summarizes these total population data for the operational areas evaluated. The operational areas evaluated changed over time to reflect the locations of major radiological activities. As indicated in the table, the population change continues an upward trend and has remained rather stable (about 20-30%) over each decade. Year 2010 was the first census year that a 50-mile population of the Hanford Site exceeded the half-million mark for any operational area centroid location.

Table 5.1. 50-mile Populations – 1990, 2000, and 2010 Census⁷

Centroid	1990 Census	2000 Census	2010 Census	Year 1990 to 2000 Change		Year 2000 to 2010 Change
