# Master Parts Catalog

This catalog is intended to be a comprehensive listing of repair parts, components, kits, and consumable items used on the equipment deployed at Second Line of Defense (SLD) sites worldwide. The catalog covers detection, central alarm station, network, ancillary equipment, and tools and is backed by a Master Parts Database that is used to generate the standard report views. This relational database contains a record for every part in the catalog along with supporting tables for normalizing fields in the records. The database also includes supporting queries, database maintenance forms, and reports.

This catalog consists of the following brief description section followed by a set of separate views of the Master Parts Database. The primary views are:

**Nomenclature view.** A list of every part in the catalog sorted alphabetically by standard name or nomenclature.

**Manufacturer view.** A similar list grouped by the part manufacturer.

**End item view.** Grouped by the major piece of equipment to which the part applies.

Additional views may be appended to the catalog as required.

## Definitions

**End item.** A final combination of end products, component parts, and/or materials that is ready for its intended use, e.g., an assembled detection system.

**Part.** A unique, individual item, set, or kit that is a replaceable component of an end item of SLD equipment.

**Kit.** An assemblage of parts, typically including those needed to install or affix a component to a larger system.

**Assembly.** An assembled collection of parts installed as single unit.

**Board.** A circuit board or similar replaceable item installed as a single unit.

**Tool.** Any general purpose or special item that is required to perform a maintenance action but is not itself a component of an assembly or end item.

## Usage and Intent

The current catalog is a draft aggregation of spares data from various sources. This version should be used only for staffing and limited planning purposes until superseded by an initial operational release, TBD.

Upon an operational release, this manual is intended for use in SLD maintenance and program management activities that address or are impacted by spares ordering, contracting, costing, stocking, sourcing, or analysis. The intent is to provide a comprehensive list that unambiguously identifies all relevant items of program-wide interest. This catalog will facilitate consistent and accurate inventory management, analysis, and decisions.

## Responsibilities

In the near term, the spares analysis team at the Pacific Northwest National Laboratory (PNNL) will continue to ingest, normalize, and clean the spares database with the aim of releasing an initial operationally useful version of the spares catalog. Ultimately, the spares database will be managed as a single database instance, tentatively as a subcomponent of the SLD Portal.

All SLD Program operators should note discrepancies and alternatives for improving structure, completeness, and data quality with the goal of rapidly maturing the database so that it can be of use throughout the program.

## Data Sources

The existing spares data records were derived from various SLD Sustainability program records including manufacturers data, site master equipment lists, LMP inventories, and purchasing records. Discovery and ingestion of data sources is ongoing. As of this draft catalog version, these sources include:

## Change Management

This is a pre-decisional, draft version of the catalog. It nominates several data standards. Every attempt has been made to collect and organize as much relevant spare parts data as possible. This document is for staffing purposes only and will be superseded by an initial operational release. Until the database is placed under formal configuration management, the catalog should not be considered version controlled.

No version marks or consistency between variants will be enforced until an initial operational release, TBD.

## Master Parts Catalog Data Definitions

The data elements defined in this chapter are an initial nominated specification for fields within catalog records.

### Nomenclature

The nomenclature field is a regularized basic name that follows a general-to-specific, comma-separated pattern of at least one and up to three levels:

**Basic name.** The fundamental function or most general useful name for an item, e.g., *CABLE*

**Basic name modifier.** A modifier to the basic name that makes the function or description more complete, a type, e.g., *USB*

**Basic name extended modifier.** An extension that distinguishes the item from similar items or makes its purpose clear, e.g., *6 FT*

The nomenclature field is backed by three tables in the spares database. These tables are used to construct the nomenclature from regularized components, e.g., *CABLE*, *USB*, *6FT*. Nomenclature is spelled out entirely in capital letters.

### Unit of Issue

Unit of issue is the count of the item that is provided by the catalog entry. Most items have basis of issue *EA* meaning each, which denotes a single item. The current unit of issue codes are defined in Table 2.

**Table 2. Unit of Issue Codes**

Code	Explanation
EA	each
KIT	kit
SET	set
HND	hundred count
GRS	gross
DOZ	twelve count
GAL	US gallon
4 PCS	4 pieces
12 PCS	12 pieces
16 PCS	16 pieces
24 PCS	24 pieces

## Cost

Cost data are maintained in current fiscal year U.S. dollars. The quality of the existing cost data vary widely depending on the source for the catalog item. Cost data are presented in this version for staffing and rough estimates only. Ultimately, cost data should reflect an authoritative planning figure, but the contract cost to deliver a particular part to a particular point of need may vary substantially from the figure in the database. Depending on the situation, it may be useful to store site- or LMP-specific costs for spare parts in a separate database linked to inventory at that site or LMP.

## Basis of Stockage Level

The basis of stockage level is the basis against which a stockage level for the part should be calculated. The basis of stockage level is paired with a quantity against which to apply the basis. For example, a part that has a basis of per 10 systems and a quantity of two should be stocked in a quantity of two per 10 systems supported by the stocking maintenance activity. The basis of stockage level and quantity data are intended for use in a business logic that accounts for rounding, minimums, and restrictions on stockage. The existing values for basis of issue are defined in Table 3.

**Table 3. Basis of Stockage Level Codes**

Code	Explanation
10 Systems	The basis of issue is quantity per 10 supported end item systems
10 CAS	The basis of issue is quantity per 10 supported CAS systems
Site	The basis of issue is quantity per supported site
None	No basis of issue, do not stock this as a spare against a basis of issue
10 OCR	The basis of issue is quantity per 10 supported OCR Systems
10 Traffic Arms	The basis of issue is quantity per 10 supported traffic arms
Each	The basis of issue is quantity per end item supported
1 System	The basis of issue is quantity per 1 supported end item system

### 1.1.1 Recoverability Code

The recoverability code provides guidance on the disposition of a failed part and the level at which parts may be disposed, determined to be economically repairable, and repaired for return to inventory. The recoverability codes are defined in Table 4.

**Table 4. Recoverability Codes**

Code	Explanation
Z	Non-recoverable; dispose of at LMP/Operator level when unserviceable
D	Recoverable; at manufacturer level
I	Recoverable; at intermediate level
O	Recoverable; at LMP level
X	No recoverability guidance for this part

### 1.1.2 Special Handling Code

Special handling codes provide guidance for parts that require special handling or are currently being recovered under special circumstances, for example for failure analysis. The special handling codes are defined in **Error! Reference source not found.**

**Table 5. Special Handling Codes**

Code	Explanation
M	Item is high value or contains high value components
H	Item contains hazardous material
F	Item should be recovered under special instruction for failure analysis
MH	High value and hazardous material
MF	High value and failure analysis required
HF	Hazardous material and failure analysis required
MHF	High value, hazardous material, and failure analysis required
X	No special handling required

### 1.1.3 Obsolescence Code

The obsolescence code is intended as a way to call out parts that are nearing end of life and will become difficult to source. It can also be used for parts that may remain in service, but that have become obsolete and will be replaced by a different part or through a system upgrade. A special case of obsolescence coding is the distinction between potted and non-potted versions of high-voltage detector components. Both versions exist in inventory and the version can be distinguished by manufacturer's part number. As the retrofit to potted parts is completed, these codes may no longer be needed. The obsolescence codes are defined in **Error! Reference source not found.**

**Table 6. Obsolescence Codes**

Code	Explanation
X	No obsolescence information available
A	Active
O	Obsolete
E	Nearing end of life
P	Potted version
NP	Non potted version
