Revision History

Revision Number	Effective Date	Description of Change
1	2/20/2024	Applied revisions to stack DV ranges so that the LV-S1, LV-S2, and LV-C2 stacks conservatively use the average DV to maximum 6 DV, while LV-S3 conservatively uses the average 1/3 DV to 3 DV. Corrected distance to disturbance values. Correction applied to Table 9, which previously listed the 1/6 DV value instead of the DV value. Correction applied to Table 15, which previously listed incorrect LV-C2 summary data. Modifications to text and tables per discussions with WA DOH
0	4/8/2022	Initial Issue

Summary

The Hanford Tank Waste Treatment and Immobilization Plant Low Activity Waste (LAW) facility stack monitor locations were qualified using scale model stacks to mitigate the risk of discovering that sampling locations do not meet the qualification criteria on the full-scale stacks. As required by the American National Standards Institute/Health Physics Society (ANSI/HPS) N13.1-1999 standard, the scale model and its sampling location were geometrically similar to the actual stack and the Reynolds numbers for both the actual and model stacks were >10,000. An additional criterion is that the product of the hydraulic diameter and mean velocity (DV) of the full-scale stack must be between 1/6 DV and 6 DV of the scale model stack tests. Verification tests of the LAW stacks were performed at normal operating conditions. The minimum 1/6 DV value, along with the maximum 6 DV value from the scale model testing, determines the range of stack flow rates for which the full-scale stack may be operated and remain in compliance with the stack verification criterion. For this analysis, the range of qualified flow rates listed is conservatively based on the average DV through 6 DV for LV-S1, LV-S2, and LV-C2, and 1/3 DV to 3 DV for LV-S3. Table S1 lists the operating flow rates along with the conservative lower and upper qualified stack flow rates for each of the LAW facility stacks. For each stack, the operating flow is below the upper qualified stack flow, which means that the scale model test results are acceptable for stack qualification.

Table S1. LAW Facility Stack Operating and Qualified Flow Rates.

Stack Parameter	LV-S1	LV-S2	LV-S3	LV-C2
Normal Operating Flow (scfm)	37,905	46,740	3,056/4,526[a]	50,680
Lower Qualified Stack Flow (scfm)[b]	7,489	10,919	872	10,212
Upper Qualified Stack Flow (scfm)[c]	56,279	112,580	7,849	80,512

a. The LV-S3 operating flow for one melter is 3,056 standard cubic feet per minute (scfm), while for two melters, it is 4,526 scfm.
b. The lower DV for the LV-S1, LV-S2, and LV-C2 stacks are the average DV from the scale model tests. The lower DV for the LV-S3 stack is 1/3 of the average DV from the scale model tests.
c. The upper DV for the LV-S1, LV-S2, and LV-C2 stacks are the maximum 6DV from the scale model tests. The upper DV for the LV-S3 stack is three times the average DV from the sale model tests.

The remaining criteria for the stack verification to be considered valid involve the flow angle and velocity uniformity results. First, the flow angle at the full-scale stack must be ≤20°. Second, the velocity uniformity at the full-scale stack must be ≤20% coefficient of variance (COV). Finally, the velocity uniformity results for the actual and scale model stack tests must agree within 5% COV. These criteria were met through the full-scale stack tests at the LAW facility. Flow angle results were primarily <10°, and all flow angle results were within the ≤20° criterion. The velocity uniformity results for each test condition ranged between 1.5% COV and 9.2% COV, which were all within the range of the target % COV values from the scale model tests.

Based on these stack verification test results, the four LAW filtered exhaust stack sampling locations meet the qualification criteria provided in the ANSI/HPS N13.1-1999 standard for all planned fan operating configurations. This includes single-fan operating conditions for LV-S1 and LV-S2, dual-fan operations for LV-S3 at both the continuous air monitor and record sampler locations, and both single-fan and dual-fan operations for LV-C2. Further changes to the system configuration or operating conditions that are outside the bounds described in this report may require additional tests or analyses to determine compliance with the standard.

Acknowledgments

Mike Wentink of Bechtel National, Inc. (BNI) was the project manager for this effort. We acknowledge support from Ryan Cioli, Bill Jackson, and Clarke Respess from BNI who facilitated Pacific Northwest National Laboratory (PNNL) staff in observing the stack tests at the Hanford Tank Waste Treatment and Immobilization Plant Low Activity Waste facility. We also acknowledge Zach Harding, Connor Everly, Jeremy Clark, and Kelly Dorsi from Bison Engineering, Inc., who performed their work with PNNL staff observing in the field during testing and asking questions.

The quality assurance measures employed to produce this document include oversight and guidance from our quality engineer, David MacPherson, as well as independent reviews from Xiao-Ying Yu and Matthew Barnett. Chrissy Charron provided administrative support for this effort. Finally, Cary Counts served as the technical editor for this document.

1.0 Introduction

Stack verification tests were performed by a Bechtel National, Inc. (BNI)/Waste Treatment Completion Company contractor at the exhaust stack monitoring location of the Hanford Tank Waste Treatment and Immobilization Plant (WTP) Low Activity Waste (LAW) facility stacks to evaluate whether it meets the applicable regulatory criteria (i.e., Washington Administrative Code, Chapter 246–247) that govern effluent monitoring systems.

Emissions from three out of the four LAW facility air exhaust stacks are estimated to remain below the 0.1-millirem per year threshold limit given in Title 40 of the Code of Federal Regulations (CFR), Part 61, National Emissions Standards for Hazardous Air Pollutants (NESHAP), Subpart H, National Emissions Standard for Emissions of Radionuclides Other than Radon from Department of Energy Facilities. However, continuous sampling of emissions is planned for the first year of stack operations for all four LAW facility stacks. The NESHAP rule requires that a sampling probe be located in the exhaust stack according to criteria established by the American National Standards Institute/Health Physics Society (ANSI/HPS) N13.1-1999 standard, Sampling and Monitoring Releases of Airborne Radioactive Substances from the Stack and Ducts of Nuclear Facilities. Compliance with the standard is demonstrated through a series of tests as described in the standard. Under certain conditions, ANSI/HPS N13.1-1999 allows results from previously tested stacks to be used instead of a full series of tests at the facility stack. For the LAW facility stacks, previous scale model test results were used, and verification tests were performed on the full-scale stack.

While a contractor to BNI performed the verification tests, Pacific Northwest National Laboratory (PNNL) provided guidance for these tests, performed data reduction following the tests, and produced this report to provide an assessment of the compliance of the stack sampling location. PNNL previously performed the scale model tests that served as the basis for these full-scale stack verification tests. This prior involvement put PNNL in a unique position to provide the data reduction rigor and process insight to evaluate these stack verification results. This document provides stack flow information, details of the stack qualification criteria, and a review of the scale model tests. Section 2.0 describes the verification test methods, while Section 3.0 describes the results of these tests. Section 4.0 compares the results from the verification tests against the scale model test results, while conclusions are summarized in Section 5.0.

The four LAW facility stacks exhaust air from general building ventilation, process areas, non-process areas, and melter offgas/vessel vent process systems. The four stacks considered are described below:

- Stack LV-S1 – Ventilates hoods and maintenance (C3) areas
- LV-S2 – Ventilates hot cells and glovebox (C5) areas
- LV-S3 – Ventilates melter offgas and vessel vent processes
- LV-C2 – Ventilates non-process (C2) areas.

Table 1 provides information about the LAW stack operations. Each ventilation system has an extra standby fan available for back-up or maintenance needs. Velocity and flow values presented in this document use standard units, and standard conditions used is 68°F and 14.7 psia.

Table 1. LAW Facility Stack Design Parameters as of February 2018

Stack Parameter	LV-S1[a]	LV-S2[b]	LV-S3[c]	LV-C2[d]
Discharge diameter (in.)	48	60	18	60
Duct diameter at sampling probes (in.)	48	60	18	60
Number of duct diameters from full-scale test port to upstream disturbance[e]	10.5	18.4	37.2 / 44.2[f]	10.5
Total available fans	2	2	3	2
Number of operating fans	1	1	2	1
Normal operating flow rates (standard cubic feet per minute [scfm])	37,905	46,740	3,056/4,526[g]	50,680

e. Based on Bechtel-provided heating, ventilation, and air conditioning diagrams and isometric drawings
f. LV-S3 distances for the record sampler (RS) and continuous air monitor (CAM) locations, respectively.
g. The LV-S3 operating flow for one melter is 3,056 scfm, while for two melters, it is 4,526 scfm.

1.1 Qualification Criteria

The qualification criteria for an air monitoring probe location are taken from ANSI/HPS N13.1-1999 and are paraphrased as follows:

1. *Angular Flow* – Sampling nozzles usually are aligned with the axis of the stack. If the air travels up the stack in a cyclonic fashion, the air velocity vector approaching a sampling nozzle could be sufficiently misaligned with the nozzle to impair extraction of particles. The average of the flow angle measurements, made at the several discrete points in the duct cross section at the position of the sampling nozzle, should not exceed 20° relative to the sampling nozzle axis.
2. *Velocity Uniformity* – The air velocity must be uniform across the stack cross section where the sample is extracted. The air velocity is measured at the same grid of points as the flow angle measurements. Uniformity is expressed as the variability of the measurements about the mean. This is expressed using the percent coefficient of variation (% COV),[1] which is the standard deviation divided by the mean and expressed as a percentage. The lower the % COV value, the more uniform the velocity. The acceptance criterion is that the air velocity must be ≤20% COV in the center two-thirds of the duct cross section at the sampling probe location.
3. *Gaseous Tracer Uniformity* – A uniform contaminant concentration in the sampling plane enables the extraction of samples that represent the true concentration within the duct. The uniformity of the concentration is first tested using a tracer gas to represent gaseous effluents. The fan is a good mixer, so injecting the tracer downstream of the fan provides worst-case results. The qualification criteria are that 1) the measured tracer gas concentration is ≤20% COV across the center two-thirds of the duct cross section at the sampling location and 2) the concentrations at any of the measurement points cannot deviate from the mean by >30%.

[1] *Coefficient of variation* also is known as *percent relative standard deviation*. The standard uses the term *coefficient of variation*, so it also is used here.

4. *Particulate Tracer Uniformity* – The second set of tests addressing contaminant concentration uniformity at the sampling position uses tracer particles large enough to exhibit inertial effects. Tracer particles of 10-μm aerodynamic diameter are used by default unless it is known that larger contaminant particles will be present in the airstream. The acceptance criterion is that the particle concentration is ≤20% COV across the center two-thirds of the duct at the sampling location.

Tests to determine if Criteria 1 through 4 are met have been conducted on scale model stacks of the exhaust ductwork and stacks from the fans to the planned position of the probes used for sampling. Scale model test results are documented in Glissmeyer, Antonio, Flaherty, and Amidan (2014); Glissmeyer, Antonio, and Flaherty (2015); and Glissmeyer, Flaherty, and Piepel (2011). The ANSI/HPS N13.1-1999 standard sets additional acceptance criteria for the use of a scale model (or another, similar stack) as a substitute for the actual stack. The criteria for the use of substitute stacks are:

- The scale model and its sampling location must be geometrically similar to the actual stack.
- The product of the hydraulic diameter and the mean velocity (DV) for the candidate stack must be within a factor of six of that of the tested stack, and the hydraulic diameters of the stack must be at least 250 mm at the sampling location. For clarity, the DV requirement can be expressed as 1/6 DV of scale model stack ≤DV of full-scale stack ≤6 DV of scale model stack.
- The Reynolds number for the actual and model stacks must be >10,000.

Finally, the scale model results are considered valid if measurements on the full-scale stack show:

- The flow angle criterion (with a mean value ≤20°) is met.
- The velocity uniformity criterion (with ≤20% COV) is met.
- The velocity uniformity results for the actual and model stacks agree within 5% COV.

1.2 Scale Model Tests

Scale model tests have been performed at PNNL using primarily 12-inch-diameter ducting to represent each of the LAW facility stacks. Glissmeyer, Antonio, Flaherty, and Amidan (2014); Glissmeyer, Antonio and Flaherty (2015); and Glissmeyer, Flaherty, and Piepel (2011) report on the complete set of tests that were performed with the scale model stacks. This includes tests of flow angle, velocity uniformity, gaseous tracer uniformity, and particulate tracer uniformity. Tests were performed for a range of conditions, including different combinations of fans and flow rates to account for the range of operating conditions that were reported by BNI at the time of the scale model tests. Test matrices for the scale model tests were designed to provide information concerning the well-mixed nature of the sampling location for each stack. That is, different stack operating condition attributes were varied with different fixed operating conditions, so in total, the full range of conditions were considered. For example, while three port locations may have been tested, each port location may not have been tested with every fan condition or operating flow rate. The resultant data across all test conditions were therefore often used in aggregate to confirm that the stack location is qualified for well-mixed sampling and monitoring.

Table 2 presents a summary of the duct diameter and range of velocity values measured during the velocity uniformity tests performed with the LAW facility scale model stacks. For consistency with both the design documents for these stacks and verification test results, the velocity values are presented in standard units (i.e., standard feet per minute [sfpm]; the standard conditions used here are 68°F and 14.7 psia). The full range of acceptable DV values for the full-scale stack qualification is 1/6 DV through 6 DV; a subset of this range was used in this analysis. For LV-S1, LV-S2, and LV-C2, the average DV through the maximum 6 DV was used, and for LV-S3, the average 1/3 DV though the average 3 DV was used. For convenience, the subset of ranges is identified as 'lower' and 'upper' to avoid conflict with the ANSI/HPS N13.1-1999 allowed full 1/6 DV to 6 DV range. Because the scale model stack diameter is nominally 1 ft, the velocity value is essentially equal to the DV value, and the lower DV values for LV-S1, LV-S2, and LV-C2 in Table 2 is therefore the average of the scale model velocity values.

Table 2. Summary of the Acceptable Ranges of Diameter x Velocity Products from LAW Scale Model Stacks

Stack	Diameter (in.)	Velocity Range (sfpm)	Lower DV[a] (ft^2/min)	Upper DV[b] (ft^2/min)
LV-S1	11.8	1,575–2,986	2,384	17,914
LV-S2	12.0	1,504–4,778	2,780	28,668
LV-S3	11.9	1,357–3,267	784	7,054
LV-C2	11.9	1,517–3,417	2,600	20,502

a. The lower DV for the LV-S1, LV-S2, and LV-C2 stacks are the average DV from the scale model tests. The lower DV for the LV-S3 stack is 1/3 of the average DV from the scale model tests.
b. The upper DV for the LV-S1, LV-S2, and LV-C2 stacks are the maximum 6DV from the scale model tests. The upper DV for the LV-S3 stack is 3 times the average DV from the sale model tests.

1.3 Quality Assurance

Work performed by PNNL staff documented in this report was performed in accordance with the Waste Treatment Plant Support Program (WTPSP) Quality Assurance Plan and associated procedures. The WTPSP implements the requirements of ASME NQA-1-2000, Quality Assurance Requirements for Nuclear Facility Applications, graded on the approach presented in NQA-1-2000, Subpart 4.2, Guidance on Graded Application of Quality Assurance (QA) for Nuclear-Related Research and Development.

The WTPSP works in conjunction with PNNL's laboratory-level Quality Management Program, which is based upon the requirements as defined in the U.S. Department of Energy Order 414.1D, Quality Assurance, and 10 CFR 830, Nuclear Safety Management, Subpart A, Quality Assurance Requirements. PNNL implements these requirements with a graded approach using the consensus standard ASME NQA-1-2000, Quality Assurance Requirements for Nuclear Facility Applications, graded on the approach presented in NQA-1-2000, Subpart 4.2, Guidance on Graded Application of Quality Assurance (QA) for Nuclear-Related Research and Development.

The WTPSP QA Plan describes the technology life cycle stages, which include the progression of technology development, commercialization, and retirement in process phases of basic and applied research and development, engineering and production, and operation until process completion. The work described in this report has been completed under the QA Technology Level of Development Work.

2.0 Verification Test Methods

Bison Engineering, Inc. (Bison), performed tests of the four LAW facility stacks during two separate week-long periods of May 24–28, 2021, and June 21–25, 2021. The test plan (Bison Engineering Inc. 2021[1]), which was informed by a PNNL test input document (Peterson 2020), provided the test matrix of stack fan configurations to be used for the tests (see Table 3). Tests in support of 40 CFR 52, Appendix E, also were performed during this test period. Those tests dictated that 14 stack flow tests be performed as an independent measurement for comparison with the stack flow monitor for each of the four stacks. As shown in Table 3, multiple tests were performed for most fan configurations because variations in results are common among field measurements.

Table 3. LAW Facility Stack Test Matrix. All tests performed at flow conditions as indicated. The same number of tests were performed for flow angle and velocity uniformity.

Stack	Fan Configuration	Nominal Flow Rate (scfm)[a]	Number of Flow Angle, Velocity Uniformity Tests
LV-S1	Fan A Only	37,000	7
	Fan B Only		7
LV-S2	Fan A Only	38,000	7
	Fan B Only		7
LV-S3	Exhausters A and B	3,700	5
	Exhausters B and C		4
	Exhausters A and C		5
LV-C2	Fans A and B	48,000	12
	Fan A Only		1
	Fan B Only		1

a. Nominal flow rates were obtained by rounding the average Bison verification test flow rate to two significant figures. The LV-S3 rate is aligned with the RS tests, while the CAM tests were slightly higher (~3,900 scfm).

Bison followed test measurement practices as described by Environmental Protection Agency (EPA) Methods 1 and 2 (40 CFR 60, Appendix A) and did not follow a separate Test Instruction or Test Procedure. Flow angle tests were performed with an S-type pitot tube, a digital level, and an electronic manometer. Velocity uniformity tests were performed with either a standard pitot tube or an S-type pitot tube and an electronic manometer, along with a desktop weather station for ambient temperature and pressure measurements and a thermocouple for in-stack temperature measurements. Each stack traverse comprised eight discrete measurement points across the diameter of the duct, plus the center point. Two traverses positioned 90° apart were used to complete each measurement set.

Figure 1 shows the four stacks as seen from the rooftop of the LAW facility. The LV-S1, LV-S2, and LV-S3 stacks are the tallest stacks and are enclosed within a common support structure. The LV-C2 stack is slightly northeast of the cluster of other stacks and is in a separate support structure because it is significantly shorter. The LV-C2 stack is also the only stack with sampling and testing locations located along the outdoor, vertical section of the stack.

[1] Bison Engineering, Inc. 2021. Low-Activity Waste Facility Flow Verification Test Plan. 24590-CM-HC4-HX00-00007. Helena, Montana.

Figure 1. Photograph of the Four LAW Stacks Taken from the Facility Rooftop. Each stack is labeled near the lowest visible portion of the stack.

Figure 2 through Figure 5 shows the testing location of each of the three LAW stacks in the L-0320 Stack Monitoring Room (for LV-S1, LV-S2, and LV-S3) and on the rooftop (for LV-C2). The LV-S1 (Figure 2) and LV-S2 (Figure 3) locations required a scissor-lift to access the testing ports. The LV-S3 (Figure 4) testing locations were both more centrally located within the room and are elevated higher above the floor, in addition to having two locations (for the CAM and RS), so a scaffold was constructed to provide access. The LV-C2 testing location (Figure 5) was on the roof but was accessible by a staff member standing on the rooftop.

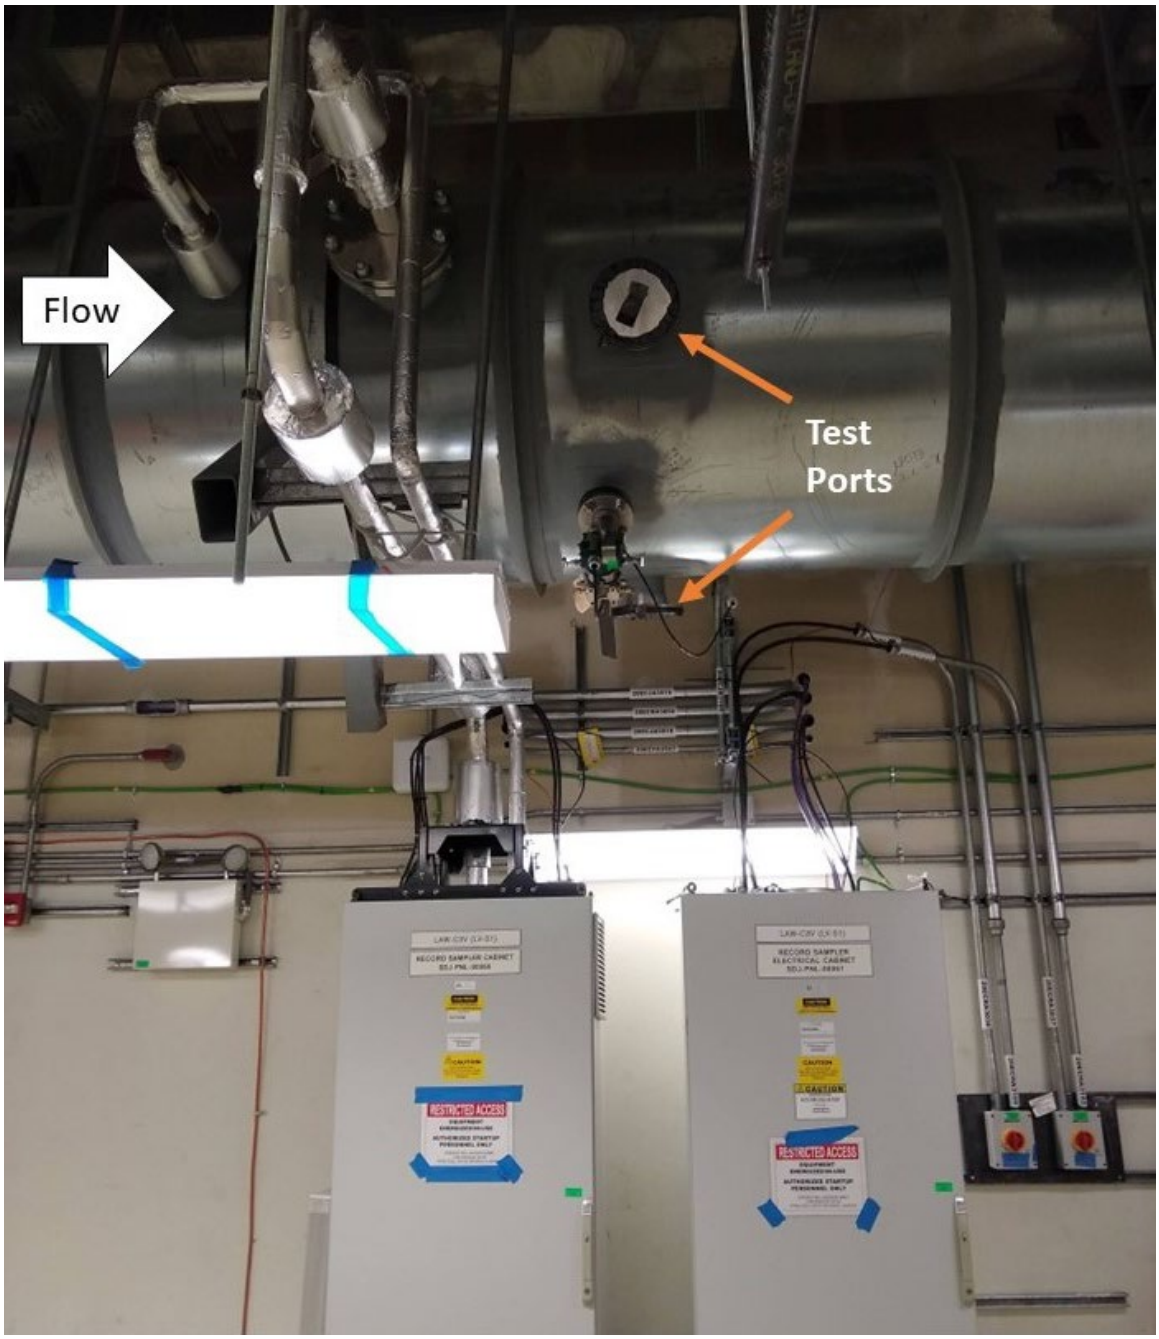

Figure 2. LAW LV-S1 Stack. The stack is positioned along the west wall of the L-0320 Stack Monitoring Room, with one test port slightly below the horizontal centerline, and the second test port slightly west of plumb (behind the probe in the photo). Stack flow is from left (south) to right (north).

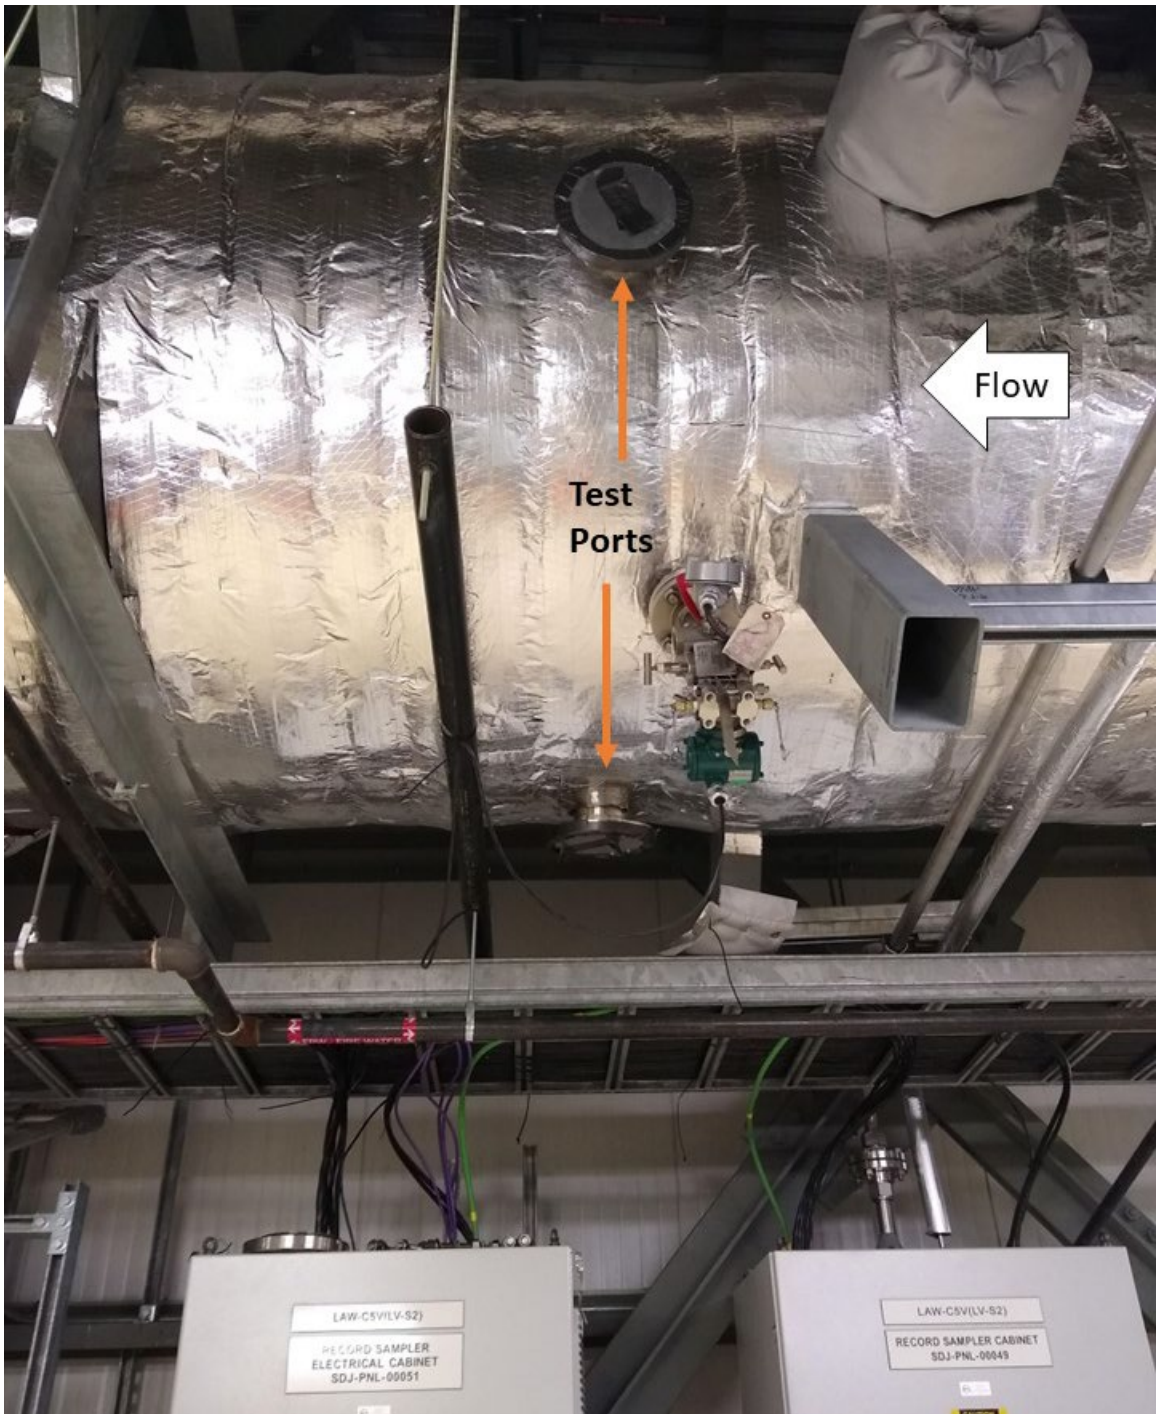

Figure 3. LAW LV-S2 Stack. The stack is positioned along the east wall of the L-0320 Stack Monitoring Room, with one test port near the horizontal centerline, and the second test port nearly plumb (behind and to the left of the probe in the photo). Stack flow is from right (south) to left (north).

Figure 4. LAW LV-S3 Stack. The pair of ports to characterize the RS port location is visible in the foreground (near the center of the image) while the ports to characterize the CAM is in the background, at the location of the Bison staff member. The stack is positioned near the center of the L-0320 Stack Monitoring Room, and the photograph is nominally pointed to the north. Stack flow is from the foreground (south) to background (north).

Figure 5. LAW LV-C2 Stack on the Facility Rooftop. The Bison staff member is measuring flow angle at the east port, and the west port is visible behind him.

For each traverse, the probe (i.e., S-type or standard pitot tube) was inserted completely into the stack such that the tip contacted the far wall, and then backed away from that wall the necessary distance to measure point 1. Triplicate measurements were made at each point before moving to the next point. Method 1 does not specify how measurements should be made and making three measurements at the traverse point is adequate. During tests, the port cover plate was replaced with a relatively thin plate with a hole in the center that was just large enough for the pitot tube, and duct tape was used to seal the opening when the port was not in use (see Figure 2, Figure 3, and Figure 4).

While Bison performed the tests under a subcontract from BNI, PNNL staff observed most tests to understand how they were executed. Because of obstructions in the test area (e.g., beams, platforms, sample cabinets, etc.), the pitot tube was not positioned exactly along the stack diameter during all portions of the test. As a result, measurements in the stack may have been co-planar, but not exactly at the specific, planned positions. This positioning of the pitot tube for sampling does not have a practical impact on the measurement results. Test staff did not appear to record any negative flow angle values in the case of LV-C2, which was along a vertical section of duct, or flow angle values greater than 90° in the case of LV-S1, LV-S2, and LV-S3, which were measurements made at horizontal duct sections. This does not impact the results because the absolute value is used but is listed here to note that all flow angle test results presented in the appendices are small positive values.

Finally, we note that equipment used for these tests generally were marked with calibration information. The barometer, digital manometer, and thermocouple, as well as the pitot tubes also were checked in-house before and after each testing trip.

3.0 Verification Test Results

PNNL was directed by BNI to use data collected by Bison to perform the LAW verification testing data reduction. PNNL staff were observers during most of the testing so that the equipment used, the measurement techniques, and data recording process could be evaluated. PNNL staff also recorded a subset of measurements from each test when observation was performed to provide secondary QA for the data. The QA process at PNNL included following the procedure for qualification of existing data through data corroboration and sponsor-directed use of data. Bison (2021[1], 2022[2]) reports documenting the verification tests were used as the basis for PNNL data processing and analysis.

Velocity-uniformity measurements collected by Bison were delta-pressure values, which then were converted to velocity values by Bison to complete the velocity uniformity data sheets. PNNL performed a spot-check of the conversions from delta pressure to velocity for these velocity uniformity tests. Data in the Bison report then were used as input to PNNL-controlled Excel spreadsheets to eliminate the possibility that unexpected calculation modifications were made in the spreadsheets transmitted to Bison. These spreadsheets then were subject to calculation reviews to document the accuracy of the calculations from both a theoretical and numerical perspective.

There are some minor differences between the values calculated in the Bison report and the values calculated by PNNL. The primary source of these differences is that Bison provided velocity values to one decimal point in the data sheets, but the value in the cells appear to have more digits (from the conversion from inches of water). The PNNL data sheets used the single decimal point values in the subsequent calculations. Appendix A, Appendix B, Appendix C, and Appendix D contain the flow angle and velocity data sheets produced by PNNL to support this analysis. Average velocities calculated by PNNL and Bison are identical for all tests.

Appendix E contains a table that summarizes the quality assurance documents that have been produced by PNNL as part of this LAW verification effort.

3.1 LV-S1 Verification Tests

Table 4 summarizes the flow angle and velocity uniformity test results from the LV-S1 stack verification tests. The DV values, calculated from the stack nominal diameter and the velocity computed from the EPA Method 1 measurement points, are included in Table 4 for reference. Note that the flow angle and velocity uniformity tests for each numbered test were performed in sequence so the velocity uniformity test flow and DV value is expected to be representative of the flow during the flow angle test as well. All test results meet the criterion of flow angle values ≤20°and velocity uniformity values ≤20% COV.

3.2 LV-S2 Verification Tests

Table 5 summarizes the flow angle and velocity uniformity test results from the LV-S2 stack verification tests. The DV values calculated from the stack nominal diameter and the velocity computed from the EPA Method 1 measurement points are included in Table 5 for reference. Note that the flow angle and velocity uniformity tests for each numbered test were performed in sequence so the velocity uniformity test flow and DV value is expected to be representative of the flow during the flow angle test as well. All test results meet the criterion of flow angle values ≤20°and velocity uniformity values ≤20% COV.

Table 5. LV-S2 Verification Test Results

Fan Configuration	Test Number	Flow Angle (°)	Velocity Uniformity Test Flow (scfm)	Velocity Uniformity (% COV)	DV (ft^2/min)
Fan A Only	1	3.3	36,800	6.9	9,372
	2	3.4	39,495	6.1	10,057
	3	4.4	37,435	4.6	9,531
	4	13.2	37,793	9.2	9,622
	5	3.4	37,836	7.0	9,637
	6	5.0	38,746	5.6	9,867
	7	3.3	37,752	2.8	9,614
Fan B Only	8	3.0	37,869	5.3	9,643
	9	2.4	38,936	1.9	9,916
	10	4.9	37,530	4.0	9,556
	11	2.4	36,828	4.6	9,380
	12	3.2	37,899	5.3	9,652
	13	2.7	38,035	4.3	9,688
	14	4.1	38,070	4.8	9,693

3.3 LV-S3 Verification Tests

Table 6 and Table 7 summarize the flow angle and velocity uniformity test results from the LV-S3 stack verification tests at the CAM and RS locations. The DV values calculated from the stack nominal diameter and the velocity computed from the EPA Method 1 measurement points are included in these tables for reference. While the stack data sheet (24590-LAW-JFD-SDJ-21130, Rev 2) listed 18 inches as the outside diameter for LV-S3, Bison recorded an inside diameter of 17 inches, which was used for the calculations presented here. Note that the flow angle and velocity uniformity tests for each numbered test were performed in sequence so the velocity uniformity test flow and DV value are expected to be representative of the flow during the flow angle test as well. All test results meet the criterion of flow angle values ≤20°and velocity uniformity values ≤20% COV.

The CAM location is downstream of the RS location, and tests were performed at the RS location first, then at the CAM location, so that each numbered test for the flow angle and velocity at each location was performed within about 1 hour. In general, the stack flow rate at the RS location, which used a standard pitot tube, was slightly lower than the stack flow measurements made at the CAM location using an S-type pitot tube. Based on comparisons with the installed stack flow measurement system, the RS location measurements are approximately 3% lower than the installed continuous emissions monitoring system. Because the installed systems agree within 1% between the CAM and RS locations, it appears there is a random low bias at the Bison-measured RS location. Given that the bias is small and cannot be attributed to any obvious source, no adjustments are made to the data. Additionally, the ANSI/HPS N13.1-1999 standard states that for continuously monitored stacks and ducts, the flow measurement and recording system shall be capable of determining the mass flowrate of the effluent stream with an accuracy that is within 10% of that measured with the reference method (i.e., 40 CFR 60, Appendix A, Methods 1 and 2). Based on the requirements of the standard, a 3% difference is acceptable.

Table 6. LV-S3 CAM Verification Test Results

Fan Configuration	Test Number	Flow Angle (°)	Velocity Uniformity Test Flow (scfm)	Velocity Uniformity (% COV)	DV (ft^2/min)
Fans A and B	1	4.6	3,882	6.6	3,489
	2	3.7	3,825	6.9	3,437
	3	5.5	3,887	6.6	3,493
	4	7.2	3,862	6.3	3,471
	5	4.2	3,854	6.1	3,464
Fans B and C	6	5.8	3,865	5.7	3,473
	7	3.1	3,847	5.7	3,458
	8	3.9	3,825	6.1	3,438
	9	5.7	3,849	5.4	3,459
Fans A and C	10	4.1	3,886	6.1	3,493
	11	2.6	3,847	6.5	3,457
	12	3.8	3,842	6.0	3,452
	13	4.0	3,854	5.5	3,464
	14	3.5	3,849	6.0	3,460

Table 7. LV-S3 RS Verification Test Results

Fan Configuration	Test Number	Flow Angle (°)	Velocity Uniformity Test Flow (scfm)	Velocity Uniformity (% COV)	DV (ft^2/min)
Fans A and B	1	3.3	3,556	6.4	3,196
	2	6.2	3,634	5.2	3,266
	3	5.1	3,690	5.1	3,316
	4	5.0	3,713	5.0	3,338

	13	3.9	3,705	5.4	3,330
	14	3.3	3,718	5.2	3,341

3.4 LV-C2 Verification Tests

Table 8 summarizes the flow angle and velocity uniformity test results from the LV-C2 stack verification tests. The DV values calculated from the stack nominal diameter and the velocity computed from the EPA Method 1 measurement points are included in Table 8 for reference. Note that the flow angle and velocity uniformity tests for each numbered test were performed in sequence so the velocity uniformity test flow and DV value is expected to be representative of the flow during the flow angle test as well. All test results meet the criterion of flow angle values ≤20° and velocity uniformity values ≤20% COV.

Table 8. LV-C2 Verification Test Results

Fan Configuration	Test Number	Flow Angle (°)	Velocity Uniformity Test Flow (scfm)	Velocity Uniformity (% COV)	DV (ft^2/min)
Fan A	1	2.3	44,156	4.1	11,243
Fans A and B	2	3.6	48,640	1.8	12,388
	3	4.2	48,237	2.7	12,284
	4	2.9	48,776	1.5	12,421

	9	3.8	49,025	2.4	12,482
	10	4.2	48,213	1.8	12,279
	11	4.7	48,071	2.0	12,243
	12	4.5	47,434	2.3	12,081
	13	3.1	47,239	2.3	12,030
Fan B	14	6.3	48,253	5.0	12,287

4.0 Comparisons of Verification Test and Scale Model Test Results

While the stack verification test results demonstrate that both the flow angle and velocity uniformity values are acceptable compared with the qualification criteria, the velocity uniformity values must be compared with the scale model test results to accept the full suite of stack qualification test results from the scale model tests. Table 9 presents a summary of the normal operating velocity for the stack, along with the corresponding DV values. Additionally, Table 9 includes the scale model lower and upper DV values for each stack. For the LV-S1, LV-S2, and LV-C2 stacks, the lower DV lists the DV values themselves, while for the LV-S3 stack, the lower DV lists 1/3 DV values. For the LV-S1, LV-S2, and LV-C2 stacks, the upper DV lists the 6 DV values, while for the LV-S3 stack, the upper DV lists the 3 DV values. The scale model ranges provide the limits of the full-scale stack DV values for which the surrogate stack may be used to represent the full-scale stack. Note that while the LV-S3 stack data sheet listed 18 inches for the outside diameter, DV calculations used 17 inches because this was the inside diameter measured in the field by Bison.

Table 9. Calculation of Acceptable DV Ranges

Stack	Diameter (in.)	Stack Design		Bison Test Condition		Scale Model	
		Operating Velocity[a] (sfpm)	DV (ft^2/min)	Test Velocity[b] (sfpm)	DV (ft^2/min)	Lower DV[c] (ft^2/min)	Upper DV[d] (ft^2/min)
LV-S1	48	3,016	12,064	2,956	11,825	1,575–2,986	9,450–17,914
LV-S2	60	2,380	11,900	1,932	9,659	1,504–4,778	9,025–28,668
LV-S3	17	1,939	2,747	2,393	3,390	452–1,089	4,071–9,801
LV-C2	60	2,582	12,910	2,442	12,212	1,517–3,417	9,099–20,502

a. Velocity based on normal operating flow velocity from stack design documents (available from PNNL).
   - LV-S1: 24590-LAW-JFD-SDJ-21040, Rev. 4
   - LV-S2: 24590-LAW-M8N-C5V-00117
   - LV-S3: 24590-LAW-M6E-LVP-00019
   - LV-C2: 24590-LAW-JFD-SDJ-21010, Rev. 4

b. Velocity based on average velocity measured during velocity uniformity tests performed by Bison.

c. The lower DV for the LV-S1, LV-S2, and LV-C2 stacks are the average DV from the scale model tests. The lower DV for the LV-S3 stack is 1/3 of the average DV from the scale model tests.

d. The upper DV for the LV-S1, LV-S2, and LV-C2 stacks are the maximum 6DV from the scale model tests. The upper DV for the LV-S3 stack is 3 times the average DV from the sale model tests.

There were minor differences between the Bison test conditions and the stack design conditions. There were slightly more substantive differences between the latest design flow rates and the conditions that were in place at the time of the scale model stack tests (e.g., LV-S1 design DV was approximately 12,000 ft^2/min, compared with the scale model DV, which was approximately 2,500 ft^2/min). Therefore, to be complete, comparisons with the scale model stack conditions are made against both sets of conditions (design document and Bison test conditions) for each stack in the sub-sections below. Note that the verification of each scale model data point is not required to qualify the sampling location for specific operating configurations or conditions. As noted in Section 1.2, the scale model tests are used to confirm the overall range of conditions for which the stack location is qualified. Table 9 summarizes that both the DV from the design document and the DV from the Bison test conditions are within the required 1/6 DV (not shown in Table 9) and 6 DV.

4.1 LV-S1 Qualification

The LV-S1 stack qualification tests were performed on a scale model of the stack constructed at a PNNL outdoor facility. The results were reported in Glissmeyer, Flaherty, and Piepel (2011). At the time of these scale model tests, the design flow rate for the stack was 40,000 scfm, with a maximum flow of 46,000 scfm (which was assumed, based on 115% of the normal flow rate). However, the latest version of the data sheet for this stack (24590-LAW-JFD-SDJ-21040, Rev. 4) reflects that the normal stack flow is 37,905 scfm and maximum flow is 48,000 scfm. While these differences are relatively minor and scale model maximum conditions remain within the range of DV values that represent the normal flow conditions, most of the scale model minimum conditions are below the range needed to represent normal full-scale flows.

Scale model tests with this stack were performed with each fan individually and at flows intended to represent the minimum and maximum stack flow rates. Table 10 presents the results of tests performed on the scale model stack.

Three test port locations were used during the scale model tests and Test Port 2, located 12.4 duct diameters from the nearest upstream disturbance, is the closest scale model port to the sampling port on the full-scale stack (located 10.5 duct diameters from the nearest upstream disturbance). Differences between the velocity uniformity results for minimum and maximum conditions or between Fan A or Fan B operations were relatively minor. Fan A, Port 2 was tested at maximum flow conditions with result of 4.5% COV and 3.6% COV for minimum flow conditions. Overall, the full-scale verification test result with a velocity uniformity value less than 8.6% COV is acceptable, based on the criterion that the two tests (full-scale and surrogate) agree within 5%. Fan B, Port 2 test results from the scale model tests were 5.7% COV on average for maximum flow conditions and 4.8% COV for the single minimum flow condition test that was performed. Velocity uniformity tests with results less than or equal to 9.8% COV meet the ANSI/HPS N13.1-1999 criterion. LV-S1 verification tests performed by Bison were between 1.5 and 3.2% COV with Fan A operations and were between 1.8 and 3.1% COV for Fan B operations, which meets the criterion.

Scale model tests of gaseous and particulate tracer uniformity were performed at the same conditions used for the velocity uniformity tests.

4.2 LV-S2 Qualification

The LV-S2 stack qualification tests were performed on a scale model of the stack constructed at a PNNL outdoor facility. The results were reported in Glissmeyer, Antonio, Flaherty, and Amidan (2014). At the time of these tests, the design flow rate for the stack was 60,117 actual cubic feet per minute (acfm), with a maximum flow of 91,019 acfm. However, the latest change document for this stack (24590-LAW-M8N-C5V-00117) reflects that the normal stack flow is 46,740 scfm. Scale model maximum conditions remain within the range of DV values that represent the normal flow conditions. The scale model minimum conditions are below the range needed to represent normal full-scale flows from the current data sheets; however, Fan A minimum test flows from the scale model tests were large enough to encompass some Bison test DV values.

Table 10. Summary of LV-S1 Scale Model Velocity Uniformity Tests. Adapted from Table 4.14 of Glissmeyer, Flaherty, and Piepel (2011).

Operating Fan(s)	Test Port	Flow Condition[a]	Test Number	Velocity (sfpm)[b]	6 DV[c] (ft^2/min)	% COV	Average % COV	Target % COV
A	1	Max	VT-19	2,984	17,902$^{D/B}$	5.9	5.6	0.6≤x≤10.6

		Max	VT-7	2,513	15,081$^{D/B}$	5.1		
		Max	VT-8	2,710	16,258$^{D/B}$	5.7		
		Max	VT-9	2,734	16,402$^{D/B}$	5.2		
		Max	VT-10	2,721	16,324$^{D/B}$	5.7		
		Min	VT-14	1,589	9,534^{N}	4.8	4.8	≤9.8
	3	Max	VT-11	2,829	16,976$^{D/B}$	6.3	6.3	1.3≤x≤11.3
		Min	VT-15	1,670	10,018^{N}	6.4	5.9	0.9≤x≤10.9
		Min	VT-16	1,668	10,006^{N}	4.7		
		Min	VT-17	1,652	9,910^{N}	6.7		

a. Labeling for maximum or minimum flow conditions (i.e., Max or Min) is based on the data provided at the time of the scale model tests and may not reflect current minimum or maximum design flow rates.
b. Velocity values previously reported in units of actual feet per minute (afpm) were converted to sfpm using 68°F as the standard temperature.
c. Superscripts in this column denote whether the listed DV value meets the criterion of exceeding the DV for the latest design values (D), the Bison test conditions (B), or both (D/B). Cases where the listed DV falls below both the data sheet and Bison flow rates are marked by (N). Design DV values are presented in Table 9, and Bison test DV values are presented in Table 4.

Scale model tests with this stack were performed with each fan individually and at flows meant to represent the minimum and maximum stack flow rates. Table 11 presents the results of tests performed on the scale model stack. Test Port 1 corresponds most closely to the location of the sampling port on the full-scale stack monitoring location. Differences between the velocity uniformity results for minimum and maximum conditions or between Fan A or Fan B operations were relatively minor. Fan A, maximum flow conditions had a result of 4.7% COV, while the minimum flow conditions had a result of 4.6% COV. This means that full-scale verification test results with a velocity uniformity value of less than or equal to 9.6% COV is clearly acceptable for Fan A cases. Fan B, maximum flow conditions had a result of 4.0% COV, while the minimum flow result was 5.1% COV. This means that full-scale verification tests with a velocity uniformity value of less than or equal to 9.0% COV is clearly acceptable for Fan B cases. Overall, velocity uniformity verification tests with results less than or equal to 9.0% COV meet the ANSI/HPS N13.1-1999 criterion. LV-S2 verification tests performed by Bison were between 2.8 and 9.2%

COV with Fan A operations and were between 1.9 and 5.3% COV for Fan B operations, which meets the criterion.

Table 11. Summary of LV-S2 Scale Model Velocity Uniformity Tests. Adapted from Table 4.1 of Glissmeyer, Antonio, Flaherty, and Amidan (2014).

Operating Fan(s)	Test Port	Flow Condition[a]	Test Number	Velocity (sfpm)[b]	6 DV[c] (ft^2/min)	% COV	Average % COV	Target % COV
A	1	Max	VT-7	4,778	28,668$^{D/B}$	4.1		
		Max	VT-8	4,458	26,750$^{D/B}$	4.6	4.7	≤9.7
		Max	VT-9	4,513	27,077$^{D/B}$	5.5		
	1	Min	VT-4	1,639	9,836^{B}	4.6		
		Min	VT-5	1,637	9,822^{B}	4.7	4.6	≤9.6
		Min	VT-6	1,660	9,962^{B}	4.5		
B	1	Max	VT-10	4,589	27,536$^{D/B}$	4.0	4.0	≤9.0
		Min	VT-1	1,520	9,122^{N}	5.1		
	1	Min	VT-2	1,505	9,031^{N}	5.2	5.1	0.1≤x≤10.1
		Min	VT-3	1,504	9,025^{N}	5.0		

a. Labeling for maximum or minimum flow conditions (i.e., Max or Min) is based on the data provided at the time of the scale model tests and may not reflect current minimum or maximum design flow rates.
b. Velocity values previously reported in units of afpm were converted to sfpm using 68°F as the standard temperature.
c. Superscripts in this column denote whether the listed DV value meets the criterion of exceeding the DV for the latest design values (D), the Bison test conditions (B), or both (D/B). Cases where the listed DV falls below both the data sheet and Bison flow rates are marked by (N). Design DV values are presented in Table 9, and Bison test DV values are presented in Table 5.

Scale model tests of gaseous and particulate tracer uniformity were performed at the same conditions used for the velocity uniformity tests and at two different injection port locations.

4.3 LV-S3 Qualification

The LV-S3 stack qualification tests were performed on a scale model of the stack constructed at a PNNL outdoor facility. The results were reported in Glissmeyer, Antonio, Flaherty, and Amidan (2014). At the time of these tests, the design flow rate for the stack was 5,631 acfm, with a maximum flow of 6,258 acfm. However, the latest change document for this stack (24590-LAW-M6E-LVP-00019) reflects that the normal stack flow is 3,056 scfm for one melter and 4,526 scfm for two melter operations. The scale model maximum, normal, and minimum conditions remain within the range of DV values that represent the normal flow conditions.

Scale model tests with this stack were performed with each fan combination and with each fan individually and at flows meant to represent the minimum, normal, and maximum stack flow rates. Table 12 presents the results of tests performed on the scale model stack for the dual-fan conditions. Two test port locations were used during the scale model tests. Test Port 1 corresponds most closely to the RS location, while Test Port 2, located five duct diameters downstream of Test Port 2, corresponds to the CAM location.

Table 12. Summary of LV-S3 Scale Model Velocity Uniformity Tests. Adapted from Table 4.5 of Glissmeyer, Antonio, Flaherty, and Amidan (2014).

Operating Fan(s)	Test Port	Flow Condition[a]	Test Number	Velocity (sfpm)[b]	6 DV[c] (ft^2/min)	% COV	Average % COV	Target % COV
A and B	1	Max	VT-1	2,870	17,219$^{D/B}$	5.9	5.9	0.9≤x≤10.9
		Norm	VT-26	2,591	15,548$^{D/B}$	6.5	6.5	1.5≤x≤11.5

A and C	1	Max	VT-18	3,251	19,508$^{D/B}$	5.1	5.1	0.1≤x≤10.1
	1	Min	VT-19	1,546	9,274$^{D/B}$	7.1	7.1	2.1≤x≤12.1

a. Labeling for maximum or minimum or flow conditions (i.e., Max or Min) is based on the data provided at the time of the scale model tests and may not reflect current minimum or maximum design flow rates.
b. Velocity values previously reported in units of afpm were converted to sfpm using 68°F as the standard temperature.
c. Superscripts in this column denote whether the listed DV value meets the criterion of exceeding the DV for the latest design values (D), the Bison test conditions (B), or both (D/B) Design DV values are presented in Table 9, and Bison test DV values are presented in Table 6 and Table 7.

The combination of Fan A and B at minimum flow conditions had an average result of 8.6% COV at the Test Port 2 location, while those same minimum flow conditions had an average result of 7.2% COV at the Test Port 1 location. Single tests were performed at the normal and maximum flow conditions, and these tests resulted in 6.5% COV and 5.9% COV, respectively. Similar results were obtained when the combination of Fan B and C were operated. In this case, multiple maximum flow tests were performed at Test Port 2 with an average result of 6.0% COV, while the Test Port 1 result at maximum flow was slightly lower, with an average of 5.5% COV. Normal and minimum flow tests at Test Port 1 were 6.0% COV and 7.0% COV, respectively. The Fan A and C combination corroborates the similar results of the other fan combinations, with a Test Port 1 maximum flow result of 5.1% COV, and a minimum flow result of 7.1% COV.

Based on these scale model results, full-scale verification test results with a velocity uniformity value between 3.6% COV and 10.1% COV meets the criteria for all cases. LV-S3 verification tests performed by Bison were between 4.0 and 6.4% COV at the RS location, which meets the criterion. CAM location results were between 5.4% COV and 6.9% COV, which also meets the criterion.

Scale model tests of gaseous and particulate tracer uniformity were performed at conditions like the velocity uniformity tests.

4.4 LV-C2 Qualification

The LV-C2 stack qualification tests were performed on a scale model of the stack constructed at a PNNL outdoor facility. The results were reported in Glissmeyer, Antonio, and Flaherty (2015). At the time of these tests, the design flow rate for the stack was 50,500 scfm, with a maximum flow of 55,550 scfm. However, the latest version of the data sheet for this stack (24590-LAW-JFD-SDJ-21010, Rev. 4) reflects that the normal stack flow is 50,680 scfm and maximum flow is 62,800 scfm. The scale model maximum and scale model normal conditions remain within the range of DV values that represent the current stack normal flow conditions. The scale model minimum conditions are below the range needed to represent normal full-scale flows.

Scale model tests with this stack were performed with each fan operated alone, as well as dual-fan operations at flows that were meant to represent the minimum, normal, and maximum stack flow rates. Table 13 presents the results of tests performed on the scale model stack.

Table 13. Summary of LV-C2 Scale Model Velocity Uniformity Tests. Adapted from Table 4.1 of Glissmeyer, Antonio, and Flaherty (2015).

Operating Fan(s)	Test Port	Flow Condition[a]	Test Number	Velocity (sfpm)[b]	6 DV[c] (ft^2/min)	% COV	Average % COV	Target % COV
A	1	Max	VT-12	3,313	19,880$^{D/B}$	2.1	2.1	≤7.1
		Norm	VT-16	2,698	16,186$^{D/B}$	2.5	2.5	≤7.5
		Min	VT-13	1,666	9,996^{N}	2.7		
		Min	VT-14	1,658	9,946^{N}	2.6	2.7	≤7.7
		Min	VT-15	1,661	9,965^{N}	2.7		
B	1	Max	VT-1	3,417	20,502$^{D/B}$	3.4		
		Max	VT-2	3,363	20,181$^{D/B}$	4.4	4.0	≤9.0
		Max	VT-3	3,347	20,081$^{D/B}$	4.2		
		Norm	VT-5	2,700	16,198$^{D/B}$	2.8		
		Norm	VT-6	2,938	17,627$^{D/B}$	4.9	4.3	≤9.3
		Norm	VT-7	2,468	14,810$^{D/B}$	5.2		
		Min	VT-4	1,517	9,099^{N}	5.1	5.1	0.1≤x≤10.1
A and B	1	Max	VT-8	3,074	18,444$^{D/B}$	3.7		
		Max	VT-9	3,073	18,441$^{D/B}$	3.2	3.4	≤8.4
		Max	VT-10	3,059	18,352$^{D/B}$	3.3		
		Min	VT-11	1,655	9,930^{N}	3.7	3.7	≤8.7

a. Labeling for maximum or minimum flow conditions (i.e., Max or Min) is based on the data provided at the time of the scale model tests and may not reflect current minimum or maximum design flow rates.
b. Velocity values previously reported in units of afpm were converted to sfpm using 68°F as the standard temperature.
c. DV values result in the latest design values (D), the Bison test conditions (B), or neither (N) fell within the range for the use of scale model stack qualification data. Design DV values are presented in Table 9, and Bison test DV values are presented in Table 8.

While there were limited numbers of tests performed at each flow condition, higher flows tended to have slightly higher levels of mixing compared with lower flows within a specific fan configuration. Fan A maximum flow conditions had a result of 2.1% COV, while the minimum flow conditions had an average result of 2.7% COV. This means that full-scale verification test results with a velocity uniformity value of less than or equal to 7.1% COV is clearly acceptable for Fan A cases. Fan B maximum flow conditions had a result of 4.0% COV, while the minimum flow result was 5.1% COV. This means that full-scale verification tests with a velocity uniformity value of less than or equal to 9.0% COV is clearly acceptable for Fan B cases. For dual-fan operations, scale model tests averaged 3.4% COV at maximum flow conditions, which results in an acceptable verification result of 8.4% COV. Overall, velocity uniformity verification tests with results less than or equal to 7.1% COV meet the ANSI/HPS N13.1-1999 criterion. The LV-S2 verification test performed by Bison was 4.1% COV with Fan A operations, 5.0% COV for Fan B operations, and were between 1.5 and 3.0% COV for dual-fan operations, which meets the criterion.

Scale model tests of gaseous and particulate tracer uniformity were performed at conditions like the velocity uniformity tests.

5.0 Summary/Discussion

The WTP LAW exhaust stack sampling and monitoring locations were qualified using scale model stacks to mitigate the risk of identifying that sampling locations do not meet the qualification criteria on the full-scale stack. As required by the ANSI/HPS N13.1-1999 standard, the scale model and its sampling locations were geometrically similar to the actual stack and the Reynolds numbers for both the actual and model stacks were >10,000. Table 14 summarizes the stack design conditions, including the duct diameter, the distance to the nearest upstream disturbance from the scale model and full-scale stack tests, and the operating fans.

Table 14. LAW Stack Design Summary

Stack Parameter	LV-S1[a]	LV-S2[b]	LV-S3[c]	LV-C2[d]
Duct diameter at sampling probes (in.)	48	60	18	60
Number of duct diameters from scale model test port to upstream disturbance	12.4	18.4	35.5 / 42.5[e]	10.0
Number of duct diameters from full-scale test port to upstream disturbance	10.5	18.4	37.2 / 44.2[e]	10.5
Total available fans	2	2	3	2
Number of operating fans	1	1	2	1
Design Normal operating flow rate (scfm)	37,905	46,740	3,056/4,526[f]	50,680

a. DS No: 24590-LAW-JFD-SDJ-21040, Rev 4 (available from PNNL)
b. DS No: 24590-LAW-JFD-SDJ-21080, Rev 3, CD No. 24590-LAW-M8N-C5V-00117 (available from PNNL)
c. DS No: 24590-LAW-JFD-SDJ-21130, Rev 2, CD No. 24590-LAW-M6E-LVP-00019 (available from PNNL)
d. DS No: 24590-LAW-JFD-SDJ-21010, Rev 4 (available from PNNL)
e. LV-S3 distances for the RS and CAM locations, respectively
f. The LV-S3 operating flow for one melter is 3,056 scfm, while for two melters, it is 4,526 scfm.

An additional criterion for the use of the scale model test results is that the DV of the full-scale stack must be between 1/6 DV and 6 DV of the scale model tests. In this analysis, the range from the average DV through 6 DV from the scale model stack tests was used for the LV-S1, LV-S2, and LV-C2 stacks and 1/3 DV through 3 DV for the LV-S3 stack. Table 15 summarizes the stack flow conditions from the verification tests along with the range of DV values from the qualification tests and the corresponding velocity and flow rates for the full-scale stacks. Verification tests were performed at normal operating conditions and did not specifically address maximum or minimum flows (as was done for the scale model tests). As a result, the average flow rate represents the typical flow rate from those tests. The lower and upper qualified stack flow rates are based on the DV values from the scale model tests and does not address other constraints, such as the rated velocity range of the shrouded probe or deposition on the probe. Based on the range of DV values and the corresponding stack flow rate range, the average verification test flow rate was within the acceptable range and the design flow rates (from Table 14) are also within the acceptable range.

Table 15. LAW Stack Sampling/Monitoring Location Qualification Summary

Stack Parameter	LV-S1	LV-S2	LV-S3	LV-C2
Verification Test Average Flow Rate (scfm)	37,147	37,930	3,772	47,956
Verification Test Average DV (ft^2/min)	11,825	9,659	3,390	12,212
Lower Scale Model DV (ft^2/min)[a]	2384	2780	784	2600
Upper Scale Model DV (ft^2/min)[b]	17,914	28,668	7,054	20,502
Lower Qualified Stack Velocity (sfpm)	596	556	553	520
Upper Qualified Stack Velocity (sfpm)	4,479	5,734	4,979	4,100
Lower Qualified Stack Flow (scfm)	7,489	10,919	872	10,212
Upper Qualified Stack Flow (scfm)	56,279	112,580	7,849	80,512

a. Lower DV values at the LAW stacks based on DV from the LV-S1, LV-S2, and LV-C2 scale model tests, or based on 1/3 DV from the LV-S3 scale model tests; also found in Table 2.
b. Upper DV values at the LAW stacks based on 6 DV from the LV-S1, LV-S2, and LV-C2 scale model tests, or based on 3 DV from the LV-S3 scale model tests; also found in Table 2 and Table 9.

The remaining criteria for the stack verification to be considered valid involve the flow angle and velocity uniformity results. First, the flow angle at the full-scale stack must be ≤20°. Second, the velocity uniformity at the full-scale stack must be ≤20% COV. Finally, the velocity uniformity results for the actual and scale model stack tests must agree within 5% COV. These criteria were met through the full-scale stack tests at the LAW facility, as shown in Table 16.

Based on these stack verification test results, the four LAW filtered exhaust stack sampling locations meet the qualification criteria provided in the ANSI/HPS N13.1-1999 standard for all fan operating conditions. This includes single-fan operating conditions for LV-S1 and LV-S2, dual-fan operations for LV-S3 at both the CAM and RS locations, and both the single-fan as well as the dual-fan operations for LV-C2. Further changes to the system configuration or operating conditions that are outside the qualified flow rates described in this report may require additional tests or analyses to determine compliance with the standard.

Table 16. LAW Stack Sampling/Monitoring Location Qualification Test Result Summary

Stack	Operating Fan(s)	Average Flow Angle (°)	Average Velocity Uniformity (% COV)	Target % COV[a]
LV-S1	Fan A Only	5.6	1.9	≤8.9
	Fan B Only	4.4	2.4	0.5≤x≤10.5
LV-S2	Fan A Only	5.1	6.0	≤9.7
	Fan B Only	3.2	4.3	≤9.8
LV-S3 CAM	Exhauster A and B	5.0	6.5	3.6≤x≤13.6
	Exhauster B and C	4.6	5.7	1.0≤x≤11.0
	Exhauster A and C	3.6	6.0	1.1≤x≤11.1[b]
LV-S3 RS	Exhauster A and B	4.5	5.3	1.8≤x≤11.8
	Exhauster B and C	3.6	5.2	0.9≤x≤10.9
	Exhauster A and C	3.5	5.1	1.1≤x≤11.1
LV-C2	Fan A Only	2.3	4.1	≤7.5
	Fan A and B	3.8	2.1	≤8.5
	Fan B Only	6.3	5.0	≤9.3

a. The % COV values are based on the most comparable scale model test conditions when available or the most conservative bounds when multiple, similarly comparable conditions exist.
b. LV-S3 scale model stack tests were not performed at Test Port 2 (the CAM location) with Fans A and C in operation. The Target % COV listed here is for the Test Port 1 result.

Notes:

Traverse point depth = the distance from the inside stack wall to each point.

Side A port was always measured first.

Direct measurements of differential pressure (in. H2O) were recorded using a digital manometer. Differential pressures were converted to the stack gas velocities (afpm) based on recorded total stack pressure, stack temperature and density of air for each run.

								Grand mean ABS	3.0
								Grand mean ABS w/o wall pts	3.4

Instuments Used:	Cal. Due
S-type pitot (ID:A100-19, 72")	Pre-test calibration; Post-test inspection.
Angle indicator SPI Tronic PRO 360 (SN 31-038-3)	Accuracy check prior to each use; field recalibration as necessary
Digi-sense 20250-13 Manometer (SN: 191212877)	Pre-test inspection; post test calibration check.

Notes:

Traverse point depth = the distance from inside stack wall to each point.

First traverse point is all the way into the stack.

Approx. air velocity was derived from all points on the Velocity Traverse Form.

Control Co. Thermometer (SN: 220435230)	Post-test verification

Notes:

Traverse point depth = the distance from the inside stack wall to each point.

Side A port was always measured first.

Direct measurements of differential pressure (in. H2O) were recorded using a digital manometer. Differential pressures were converted to the stack gas velocities (afpm) based on recorded total stack pressure, stack temperature and density of air for each run.

Angle indicator	SPI Tronic PRO 360 (SN 31-038-3)	Accuracy check prior to each use; field recalibration as necessary
Manometer	Digisense 20250-13 (SN: 191212877)	Pre-test inspection; post test calibration check.

Notes:

Traverse point depth = the distance from inside stack wall to each point.

First traverse point is all the way into the stack.

Approx. air velocity was derived from all points on the Velocity Traverse Forms.

								Grand mean ABS w/o wall pts	3.3

Instuments Used:		Cal. Due
S-type pitot	(ID: 2A, 24")	Pre-test calibration; Post-test inspection.
Angle indicator	SPI Tronic PRO 360 (SN 31-038-3)	Accuracy check prior to each use; field recalibration as necessary
Manometer	Digisense 20250-13 (SN: 191212877)	Pre-test inspection; post test calibration check.

Notes:

Traverse point depth = the distance from inside stack wall to each point.

First traverse point is all the way into the stack.

Approx. air velocity was derived from all points on the Velocity Traverse Forms.

							Grand mean ABS w/o wall pts		2.8

Instuments Used:		Cal. Due
S-type pitot	(ID: 2A, 24")	Pre-test calibration; Post-test inspection.
Angle indicator	SPI Tronic PRO 360 (SN 31-038-3)	Accuracy check prior to each use; field recalibration as necessary
Manometer	Digisense 20250-13 (SN: 191212877)	Pre-test inspection; post test calibration check.

Notes:

Traverse point depth = the distance from inside stack wall to each point.

First traverse point is all the way into the stack.

Approx. air velocity was derived from all points on the Velocity Traverse Forms.

Notes:

Traverse point depth = the distance from the inside stack wall to each point.

Side A port was always measured first.

Direct measurements of differential pressure (in. H2O) were recorded using a digital manometer. Differential pressures were converted to the stack gas velocities (afpm) based on recorded total stack pressure, stack temperature and density of air for each run.

Notes:

Traverse point depth = the distance from the inside stack wall to each point.

Side A port was always measured first.

Direct measurements of differential pressure (in. H2O) were recorded using a digital manometer. Differential pressures were converted to the stack gas velocities (afpm) based on recorded total stack pressure, stack temperature and density of air for each run.

Ambient humidity	21%	21%	RH

Instuments Used:	Cal Due
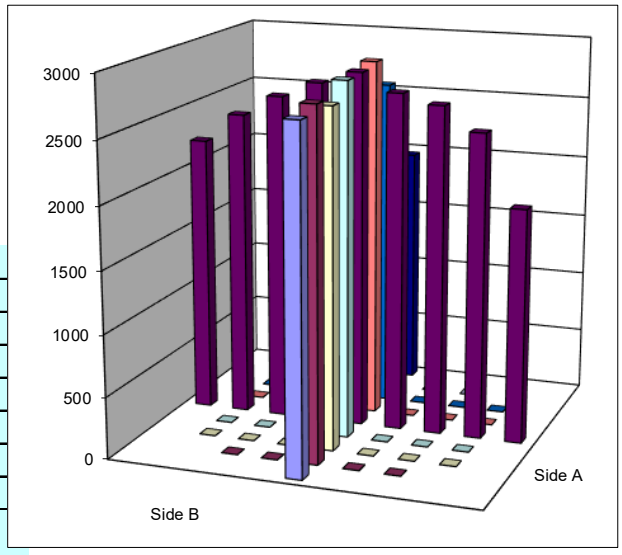
Standard pitot (ID: HStd1, 36")	Post-test inspection
Digi-sense 20250-13 Manometer (SN: 191212877)	12/3/2021
Control Co. Thermometer (SN: 220435230)	Post-test verification



Notes:

Traverse point depth = the distance from the inside stack wall to each point.

Side A port was always measured first.

Direct measurements of differential pressure (in. H2O) were recorded using a digital manometer. Differential pressures were converted to the stack gas velocities (afpm) based on recorded total stack pressure, stack temperature and density of air for each run.

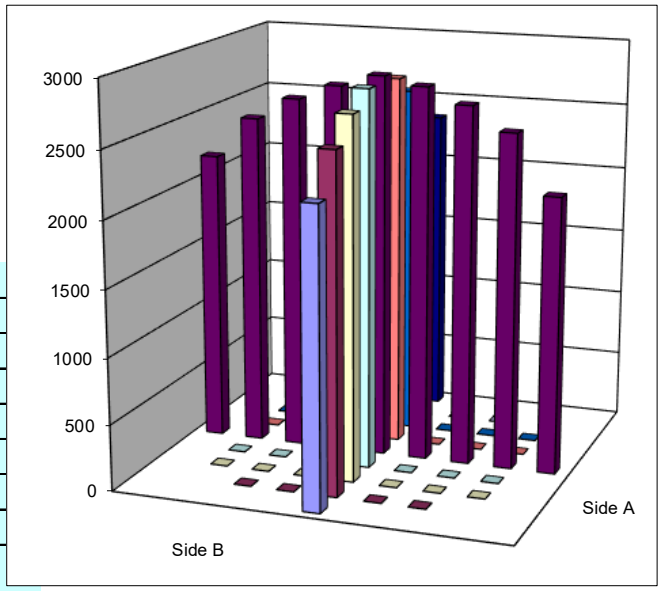
Digi-sense 20250-13 Manometer (SN: 191212877)	12/3/2021
Control Co. Thermometer (SN: 220435230)	Post-test verification



Notes:

Traverse point depth = the distance from the inside stack wall to each point.

Side A port was always measured first.

Direct measurements of differential pressure (in. H2O) were recorded using a digital manometer. Differential pressures were converted to the stack gas velocities (afpm) based on recorded total stack pressure, stack temperature and density of air for each run.

Digi-sense 20250-13 Manometer (SN: 191212877)	12/3/2021
Control Co. Thermometer (SN: 220435230)	Post-test verification

	Start	Finish	
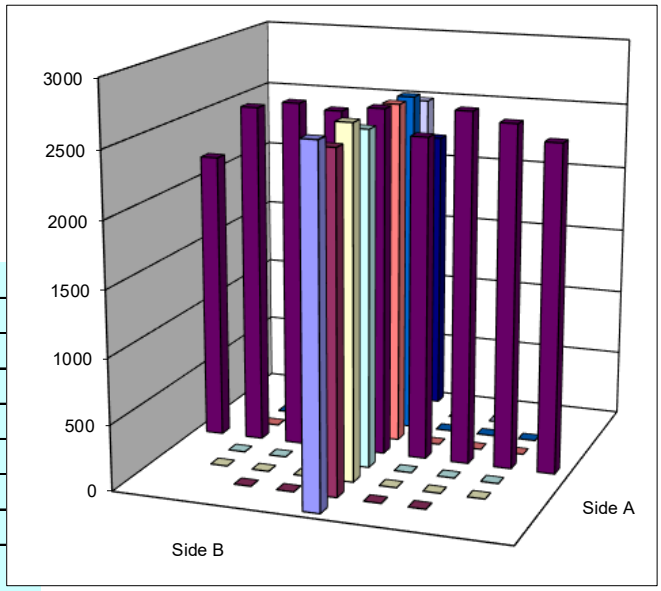
Stack temp	79.1	80.2	F
Equipment temp	76.1	75.1	F
Ambient temp	76.1	75.1	F
Stack static	0.25	0.27	mbars
Ambient pressure	984.42	984.76	mbars
Total Stack pressure	984.67	985.03	mbars
Ambient humidity	31%	32%	RH



Notes:

Traverse point depth = the distance from the inside stack wall to each point.

Side A port was always measured first.

Direct measurements of differential pressure (in. H2O) were recorded using a digital manometer. Differential pressures were converted to the stack gas velocities (afpm) based on recorded total stack pressure, stack temperature and density of air for each run.

Appendix E – Low Activity Waste Stack Verification Document Summary

The following table provides a summary of the documents produced by Pacific Northwest National Laboratory (PNNL) during low activity waste (LAW) Verification Test activities.

Document Title	Document Number	Notes
LAW Verification Test Input Document	Attachment to WTP/RPP-MOA-PNNL-01019, Rev. 0	Test input document to provide information to Bison Engineering Inc. (Bison) and Waste Treatment Completion Company (WTCC) concerning the verification tests. Transmitted as an attachment to a memo.
WTP LAW Stack Verification Tests of Velocity Uniformity and Flow Angle Provided by Bechtel National, Inc.	TDP-WTPSP-946	Test Data Package to contain the data sheets collected by Bison
Qualification of LAW Stack Verification Testing Data Collected by Bison Engineering	DQP-WTPSP-0005 Rev. 0	Data Qualification Plan to describe the qualification of the data from WTCC
Qualification of LAW Stack Verification Testing Data Collected by Bison Engineering	N/A	Data Qualification Evaluation to assess whether the data from WTCC are acceptable using data corroboration method
Qualification of LAW Stack Verification Testing Data Collected by Bison Engineering	DQR-WTPSP-0005 Rev. 0	Data Qualification Report to document the results of the data evaluation(s)
LAW Stack Verification Testing Observation Forms	TDP-WTPSP-945	Test Data Package to contain the observation forms PNNL staff used when observing Bison tests
Determine Air Velocity Uniformity of LV-C2, LV-S2, LV-S2, and LV-S3	CCP-WTPSP-1380, Rev. 0	Calculation package to document and review equations and calculations performed to determine velocity uniformity
Determination of Flow Angles in LV-C2, LV-S1, LV-S2, and LV-S3 (CAM and RS) Stacks	CCP-WTPSP-1381, Rev. 0	Calculation package to document and review equations and calculations performed to determine flow angle
Determine the product of the hydraulic diameter and the mean velocity of LAW Stacks	CCP-WTPSP-1384, Rev. 1	Calculation package to document and review equations and calculations performed to determine DV values for the Bison tests and the scale model tests.
Documentation to support stack sampling location distance to disturbance	WTPSP-DP-966, Rev 0	Data package to contain the WTP LAW stack drawings showing the sample probe location(s) and nearest upstream disturbance.
Determine Distance to Disturbance for LAW Stacks	WTPSP-CCP-1391, Rev. 0	Calculation package to document and review calculations of the distances to the nearest upstream disturbance for each of the LAW sampling ports.
