### **TCF Final Report**

## Final TCF Report for Integrated Capture and Conversion of CO<sub>2</sub> to Methanol (ICCCM) Process Technology

TCF-19-17862

Robert Dagle, Jothi Kothandaraman, and David Heldebrant

Pacific Northwest National Laboratory

November 18, 2022

Prepared for the U.S. Department of Energy Office of Technology Transitions

#### DISCLAIMER

This information was prepared as an account of work sponsored by an agency of the U.S. Government. Neither the U.S. Government nor any agency thereof, nor any of their employees, makes any warranty, expressed or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness, of any information, apparatus, product, or process disclosed, or represents that its use would not infringe privately owned rights. References herein to any specific commercial product, process, or service by trade name, trade mark, manufacturer, or otherwise, does not necessarily constitute or imply its endorsement, recommendation, or favoring by the U.S. Government or any agency thereof. TCF-19-17862

#### **PROJECT INFORMATION**

TCF Tracking Number: TCF-19-17862Start Date: 2/2/2020Completion Date: 9/30/2022Point(s) of Contact at DOE Facility: Naomi R. Oneil (DOE-FECM)

Partner(s) and Point(s) of Contact: Southern California Gas Company, POC: Flavio da Cruz

Type of partnership agreement used: CRADA

#### FUNDING TABLE

	TCF Funding		Matching Funding	
Year	Planned	Planned Actual		Actual
1	300,000	300,000	300,000	300,000
2	300,000	300,000	300,000	300,000
Total	600,000	600,000	600,000	600,000

TCF-19-17862

TCF-19-17862

#### SCOPE AND OBJECTIVE

The goal of this project is to develop a prototype system that integrates the capture and catalytic hydrogenation of  $CO_2$  into methanol in the same solvent. Ultimately, this integrated approach could provide a technology with projected reductions to capital and operating costs by at least 20% relative to a benchmark methanol synthesis via gas-phase  $CO_2$  hydrogenation. There were five primary objectives for the project:

- 1. Optimize the selections of both the catalysts and the CO<sub>2</sub> capture solvents to achieve high conversion (>80%) and high selectivity (>90%) toward methanol in the targeted processing ranges (100-180°C, 1-60 bar).
- 2. Design a reactor system that provides a fixed catalyst surface area and high-efficiency heat exchange to assure compact modular processing.
- 3. Build and test a reactor system and demonstrate in a bench scale continuous flow system, and use the operating data to refine the comparison to existing conversion technologies.
- 4. Refine techno economic (TEA) and Tech-to-Market (TTM) analyses using the experimental data obtained from the bench-scale system.
- 5. Use the experimental data and TEA/TTM projections to develop a conceptual design for a precommercial system that targets a specific market opportunity.

#### **PROJECT ACCOMPLISHMENTS**

#### **Benefit to DOE**

PNNL's Integrated Capture and Conversion of  $CO_2$  to Methanol (ICCCM) process technology offers the potential for significant cost savings relevant to the more commonly evaluated approaches toward carbon capture, use, and storage (CCUS). Since  $CO_2$  is directly converted to methanol on the ICCCM solvent, no mechanical compression of the  $CO_2$  is required for transport, which is an energy-intensive step. Additionally, energy required for  $CO_2$  capture is partially offset by the exothermic methanol synthesis. Reducing the need for these additional energy inputs, and the associated equipment enables ICCCM to be a viable technology for modular distributed-scale processing platforms. ICCCM is envisioned as a technology that could be deployed in a wide distribution of applications and product streams, such as the separation and conversion of  $CO_2$  from landfill gases, waste-water treatment gases, and manure gas sources. Stranded hydrogen sources are also more likely to be co-sourced when considering distributed processing, which could enable lower cost/ renewable hydrogen supplies in many applications.

#### **Market Viability**

At project inception, only proof of concept for this technology existed as described in our earlier report<sup>a</sup>. We had demonstrated combined capture and conversion of  $CO_2$  to methanol when using tertiary amine and alcohol in the presence of a conventional methanol synthesis catalyst. However, the yield to product was low. Further, this early system utilized a solvent that is not commercially relevant for post combustion  $CO_2$  capture. In this TCF project, we further developed the concept for combined capture and conversion when using PNNL's leading lean water capture solvent, EEMPA (N-(2-ethoxyethyl)-3-morpholinopropan-1-amine). PNNL has spent years developing this solvent system which in 2021 was projected to capture  $CO_2$  at a cost of \$47 per metric ton of  $CO_2$ , about 19% lower than the industrial benchmark, Cansolv<sup>b</sup>. We estimate this EEMPA based technology for carbon capture to be at a technology readiness level (TRL) of 5-6. Next year, the PNNL team will produce 4,000 gallons of EEMPA to test in the facilities at the National

Carbon Capture Center in Shelby County, Alabama in a project led by the Electric Power Research Institute (EPRI) in partnership with Research Triangle Institute. This TCF project leveraged PNNL's solvent-based carbon capture capabilities, and other expertise in catalysis and chemical process development.

At project completion, a new process technology was developed that utilizes EEMPA for synergistic capture and conversion in the condensed phase. In the processing first  $CO_2$  from flue gas is captured when using EEMPA. Then  $CO_2$ -captured EEMPA is co-fed with  $H_2$  to produce either methanol (and higher alcohols) or methane. The product slate can be tuned by changing the catalyst and processing conditions. Major accomplishments and findings made on this project include the following:

- Catalytically reacting CO<sub>2</sub> in capture medium bypasses CO<sub>2</sub> release and compression energy
- Captured CO<sub>2</sub> reacts differently in the condensed phase than gaseous CO<sub>2</sub>, opening new doors for reactivity
- Catalytic with respect to capture solvent
- Parallel production of methanol and methane (and higher alcohols) demonstrated by changing reagent feed, conditions, and catalyst
- Market adaptability, helps avoid oversaturation of a single market/product
- Heterogenous catalysts developed that are selective for C-N cleavage, therefore leading to selective methanol or methane formation and without the need for additional co-feeds (e.g., ethanol)
- Combined capture and conversion of CO<sub>2</sub> demonstrated with simulated flue gas

#### **Generated Data and Reports**

Four journal articles have been either published (2) or drafted (2) as a result of this work. These include the two published papers:

- "Integrated Capture and Conversion of CO<sub>2</sub> to Methanol in a Post-Combustion Capture Solvent: Heterogeneous Catalysts for Selective C-N Bond Cleavage" in *Adv. Energy Mater.*, 2022, 2202369
- "Integrated Capture and Conversion of CO<sub>2</sub> to Methane Using a Water-lean, Post-Combustion CO<sub>2</sub> Capture Solvent" in *ChemSusChem*, 2021,14,4812–4819

Three patents (2) or patent applications (1) have resulted from this work:

- U.S. patent 10,961,173
- U.S. patent 11,492,302
- U.S. patent application 63/332,817

#### Path Forward

In future work we will further advance this technology with the following goals:

- Increase conversion and activity for both methanol and methane
- Better understand causes for catalyst deactivation(s) and mitigate through improved catalyst design
- Fully integrate capture and conversion bench-scale testing
- Leverage same ICCCM platform and demonstrate potential for additional product flexibility by changing catalyst / co-feed/ conditions
- Expand reactivity to new > C2 products (thus far > 7 products identified)

A new three year project funded by DOE-FECM and SoCalGas will start in FY23 to continue the catalytic process development and develop new routes to additional products. We are also in discussions with companies about potential licensing and co-development activities.

## **APPENDIX A: CLOSEOUT CHECKLIST**

Yes	No	N/A	Check the appropriate response(s) to the following statements:
$\boxtimes$			All proposed work identified under the project and all outstanding issues have been completed and/or resolved.
$\boxtimes$			Partner(s) (if applicable) has been notified of the completion of the project and established date of completion.
$\boxtimes$			Protected CRADA Information has been stamped, when appropriate, in accordance with the CRADA and DOE Facility policy.
$\boxtimes$			Funding Program Office notified of completion, and established date of completion
$\boxtimes$			Office of Technology Transitions notified of completion, and established date of completion
$\boxtimes$			Remaining funds dispositioned

## **CONSTRAINTS/EXTERNAL INFLUENCES**

If the activity was unsuccessful, select one or more of the following reasons.Technical or manufacturing problemsChanges in market conditionsFunding AvailabilityCompeting TechnologyPersonnel ChangesLegislative/Regulatory ImpactsWork Scope ChangesChanges in Partner Objectives

Other (please specify): Click here to enter text.

## **FOLLOW-ON ACTIVITIES**

If applicable, check the box(es) below to identify follow-on activity that resulted from your project. In the adjacent column enter a number to indicate how many of each. (e.g.,  $\boxtimes$  CRADAs # 2 indicates that your project resulted in two follow-on CRADAs.)

Activity	Number of instances	Activity	Number of instances
⊠CRADAs	#1	□Licenses	#Click here to enter #.

#### ACKNOWLEDGEMENTS

Signatures below indicates the following:

- 1. The Partner(s) (if applicable) has reviewed the final report and concurs with the statements made therein.
- 2. The Partner (if applicable) agrees that any modifications from the initial proposal were discussed and agreed to during the term of the project.
- 3. The Partner (if applicable) certifies that all reports either complete or in process are listed and all subject inventions and the associated intellectual property protection measures attributable to the project have been disclosed or are included on a list attached to this report.
