Hanford Site Regional Population – 2020 Census

December 2022

SA Rose
JD Tagesad
SF Snyder

Prepared for
the U.S. Department of Energy
under Contract DE-AC05-76RL01830

Pacific Northwest National Laboratory
Richland, Washington 99354

Summary

The U.S. Department of Energy (DOE) conducts radiological operations in south-central Washington State. Population dose estimates must be performed to provide a measure of the impact from site radiological releases. Results of the U.S. 2020 Census were used to determine counts and distributions for the residential population located within 50 miles (80 kilometers) of several operating areas of the Hanford Site. Year 2010 was the first census year that a 50-mile population of a Hanford Site operational area exceeded the half-million mark. All five locations evaluated in this report for the year 2020 census exceeded the half-million mark for 50-mile populations.

Acronyms and Abbreviations

100K	DOE Hanford Site, 100-K Area
200E	DOE Hanford Site, 200-East Area
200W	DOE Hanford Site, 200-West Area
300 Area	DOE Hanford Site, 300 Area
400 Area	DOE Hanford Site, 400 Area
DOE	U.S. Department of Energy
GIS	Geographic Information Systems
HMS	Hanford Meteorological Station
km	kilometer(s); 1 km = 0.621 mi
mi	mile(s); 1 mi = 1.609 km
PFP	Plutonium Finishing Plant
WTP	Waste Treatment & Immobilization Plant

1.0 Introduction

The 2020 U.S. Census data were used to update 50-mile (80-km) residential population data relative to five major operating areas of the U.S. Department of Energy Hanford Site in Washington State. This information updates prior Census evaluation reports:

- Beck et al. (1991), which provided data from the 1990 Census,
- Elliott et al. (2004), which provided data from the year 2000 Census, and
- Hamilton and Snyder (2011), which provided data from the year 2010 Census.

As in prior reports, for this 2020 Census report, the population within 50-miles is provided for a radial grid of 160 segments centered on each of five operating areas (see Section 2.0). As an example, Figure 1.1 indicates the Hanford Site boundary and county borders with the 50-mile grid centered on the Hanford Site, 200-West Area (200W). Gilliam, Morrow, and Umatilla Counties are in Oregon. All other counties are in Washington.

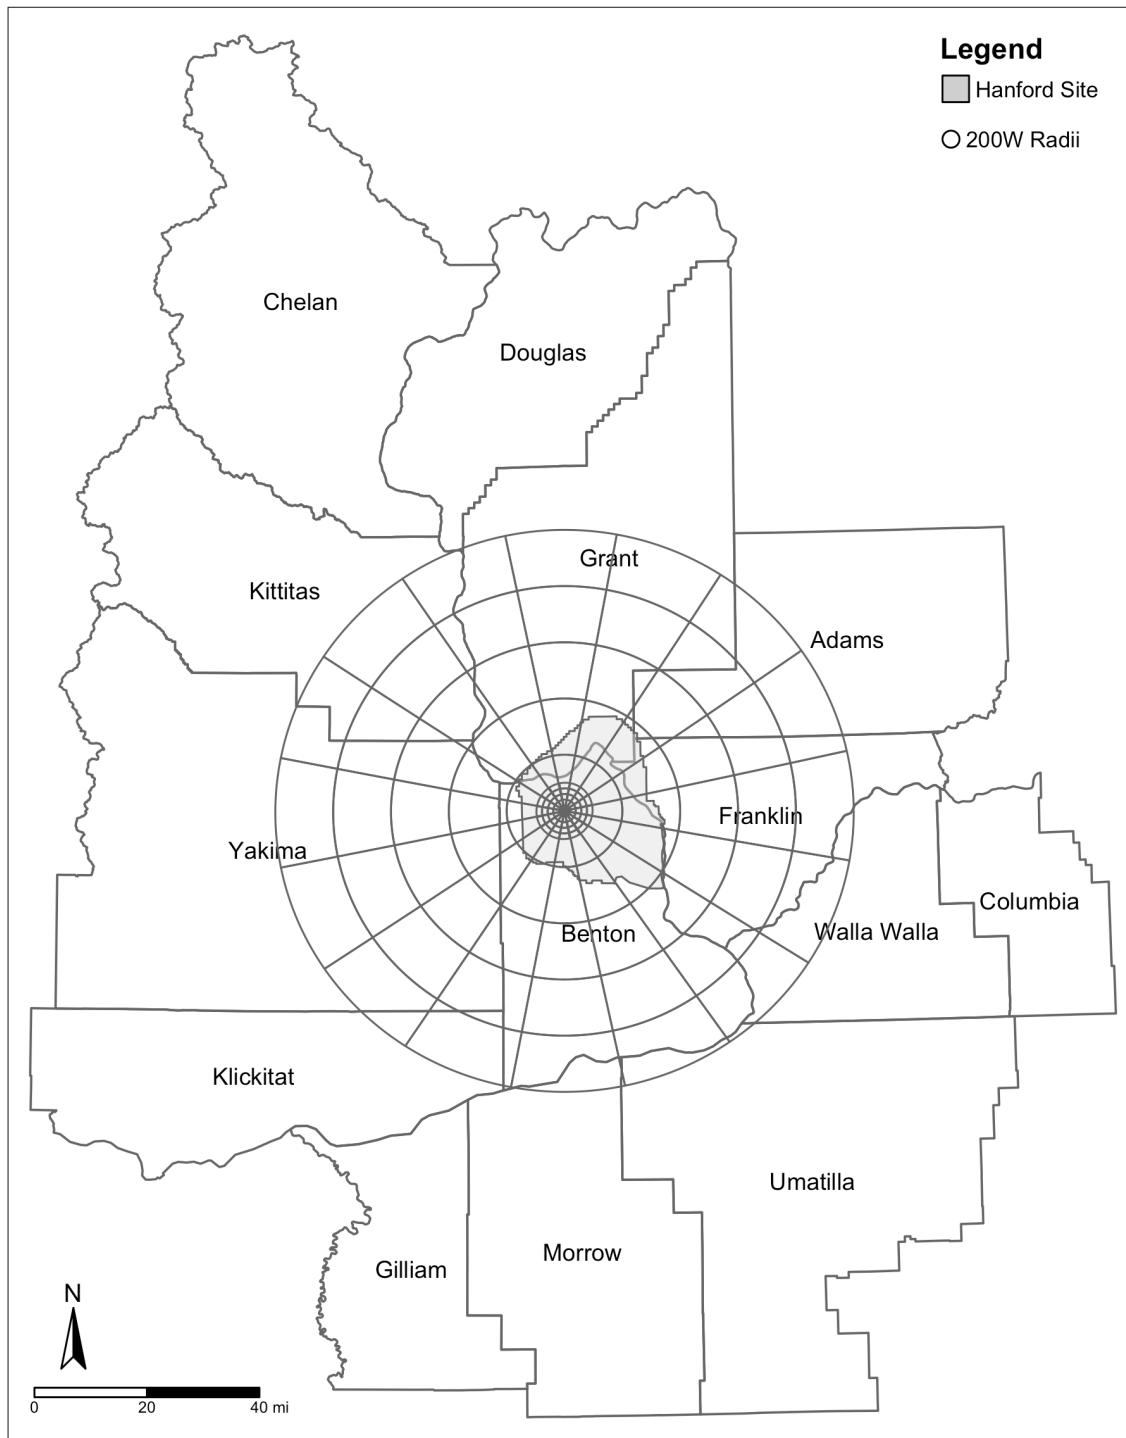

Figure 1.1. 200-West 50-mile Region and County Overlay

2.0 Data Evaluation

Statistical software, R (R Core Team 2022), with Geographic Information Systems (GIS) packages, sf (Pebesma 2018), tigris (Walker 2022), tmap (Tennekes 2018), ggplot2 (Wickham 2016), and tidyCensus (Walker and Herman 2022), were used to create direction- and distance-specific circular grids centered on each of five Hanford Site locations: 100 K Area, 200W, eastern 200-East Area's Waste Treatment & Immobilization Plant (200E [WTP]), 300 Area, and the 400 Area (Table 2.1; Figure 2.1). The grids contained concentric circles with radii of 1, 2, 3, 4, 5, 10, 20, 30, 40, and 50 miles, expanding from the point of one of five Hanford locations.

The 16 directional sectors of the grid were created using the four cardinal directions (N, E, S, W), the four ordinal directions (NE, SE, SW, NW), and the eight half-wind directions (NNE, ENE, ESE, SSE, SSW, WSW, WNW, NNW). The 10 concentric distance circles were then combined with the 16 directional sectors to create a circular grid with 160 sections (Figure 2.2 through Figure 2.6).

Table 2.1 Locations of Hanford Site Operating Areas

Operating Area	Longitude	Latitude	State Plane X (meters)	State Plane Y (meters)
100K	-119.5985	46.6481	569006	146530.6
200W	-119.6323	46.5539	566534	136031.6
200E (WTP)	-119.5058	46.5516	576236.6	135890.4
300	-119.2750	46.3685	594249.5	115790.1
400	-119.3624	46.4352	587418.6	123102.3

In order to determine the population totals for each circular grid section, Census 2020 Tiger/Line block-level shapefiles containing Census 2020 Redistricting population totals (Census 2020a, 2020b) were brought into R via Census API accessing package tidyCensus and tigris (Walker 2022, Walker and Herman 2022). The area was calculated for each block and the population was assumed to be evenly distributed within that area. Then the block-level boundaries were intersected with the circular grids. The area was again calculated for the newly intersected blocks. To calculate a new population for each of the 160 grid segments, the areas for the block portions within a grid were multiplied by their respective original average census block population densities, then summed and rounded to the nearest whole number. For example, if a circular grid section contained 40% of the original area of a block, then it was assumed that the section also contained 40% of the block's original population. This procedure was repeated for grids centered at each location of interest to create the 50-mile (80-km) population distribution based on the 2020 Census data. See Figure 2.2 through Figure 2.6 for census block overlays with the 50-mile radial grid. All circular grids, census blocks, and site centroids were projected to NAD83 Washington State Plane South (EPSG:32149) prior to analysis.

3.0 Data Graphics and Tables

The data resulting from the evaluation described in Section 2.0 are presented here in graphic and tabular forms. The user can then format the population distributions as needed for a particular application. Figure 3.1 through Figure 3.5 indicate the 5-10 mile and additional 10 mile-increment populations in the larger grid, and the 1-mile increment populations in the smaller 0-5 mile inset. Grid directions follow the compass rose with the top center sectors as North. Table 3.1 through Table 3.5 present the data in tabular form.

4.0 Notes on Data Use

The data presented in this report strictly follow the evaluation procedure described, and no additional verification has been performed. The process of averaging populations over the census block area may indicate the presence of a residential individual where none exists, or no individuals where one does exist. In addition, census data may not be complete for some census blocks due to collection issues within the U.S. Census. These are important factors to consider, especially for dose calculations at distances in closer proximity to an emission source.

5.0 Summary of Population Data

The 50-mile populations have been evaluated from 1990 (Beck et al. 1991), 2000 (Elliott et al. 2004), 2010 (Hamilton and Snyder 2011), and the current 2020 U.S. Census data. Table 5.1 summarizes these total population data for the operational areas evaluated. The operational areas evaluated changed over time to reflect the locations of major radiological activities. As indicated in the table, the population change continues an upward trend and has remained rather stable (about 20-30%) over each decade. However, the 2020 analysis revealed the largest percent change (41%) for the 300 Area 50-mile population, largely due to Tri-Cities area (Richland, Kennewick, Pasco, plus West Richland) and Walla Walla population increases.

Table 5.1 50-mile Populations – 1990, 2000, 2010, and 2020 Census

Hanford Site Centroid	1990 Census	2000 Census	2010 Census	2020 Census	Year 2010 to 2020 Change
100F	303,022	382,206	N/A	N/A	N/A

200W (central)	N/A	N/A	N/A	724,233	N/A ^(a)
200E (WTP)	N/A	N/A	553,516	697,065	26% increase
300 Area	281,586	349,067	432,117	609,715	41% increase
400 Area	283,228	353,712	442,745	585,574	32% increase

(a) A 23% increase from the 2010 Census 200HMS value.

HMS= Hanford Meteorological Station, PFP= Plutonium Finishing Plant, WTP= Waste Treatment Plant

A principal use of this population data is for the determination of offsite collective dose from radioactive material emissions in air effluent. In general, receptors closer to an air emission point will incur a greater collective dose. Data tabulated in Section 3 indicate that the 300 Area centroid has the largest number of receptors within 5 miles (31,304) compared to other centroids (i.e., 100K [9], 200W [0], WTP [0], 400 [126]).

Figures 5.1 and 5.2 illustrate the trends of Hanford-area cities in Washington by Census population (Figure 5.1) and percent change between Census counts (Figure 5.2).
