

The effects of land unit boundaries on GCAM land use and land cover projection

Alan V. Di Vittorio

Lawrence Berkeley National Laboratory

With special thanks to Page Kyle and Pralit Patel

IA/GCAM annual workshop
21 October 2014

Global distributions of Paddy Rice Production

AEZ boundaries affect projected land use/cover

Southern South America (new minus old)

4

Different boundaries give different “local” estimates

12.66 °C

Temperature maximum, Jan. 1, 2003
Cell size is 2.5 minutes (~5 km)

IAMs have different regions/land units

- Unquantified spatial uncertainty confounds inter-model comparison and ensemble analysis

Model	Regions	Land units for use projection
IMAGE (RCP 2.6)	26	half-degree grid
MiniCAM (RCP 4.5)	14	GCAM: 151 land units
AIM (RCP 6.0)	24	half-degree grid
MESSAGE (RCP 8.5)	11	half-degree grid

6

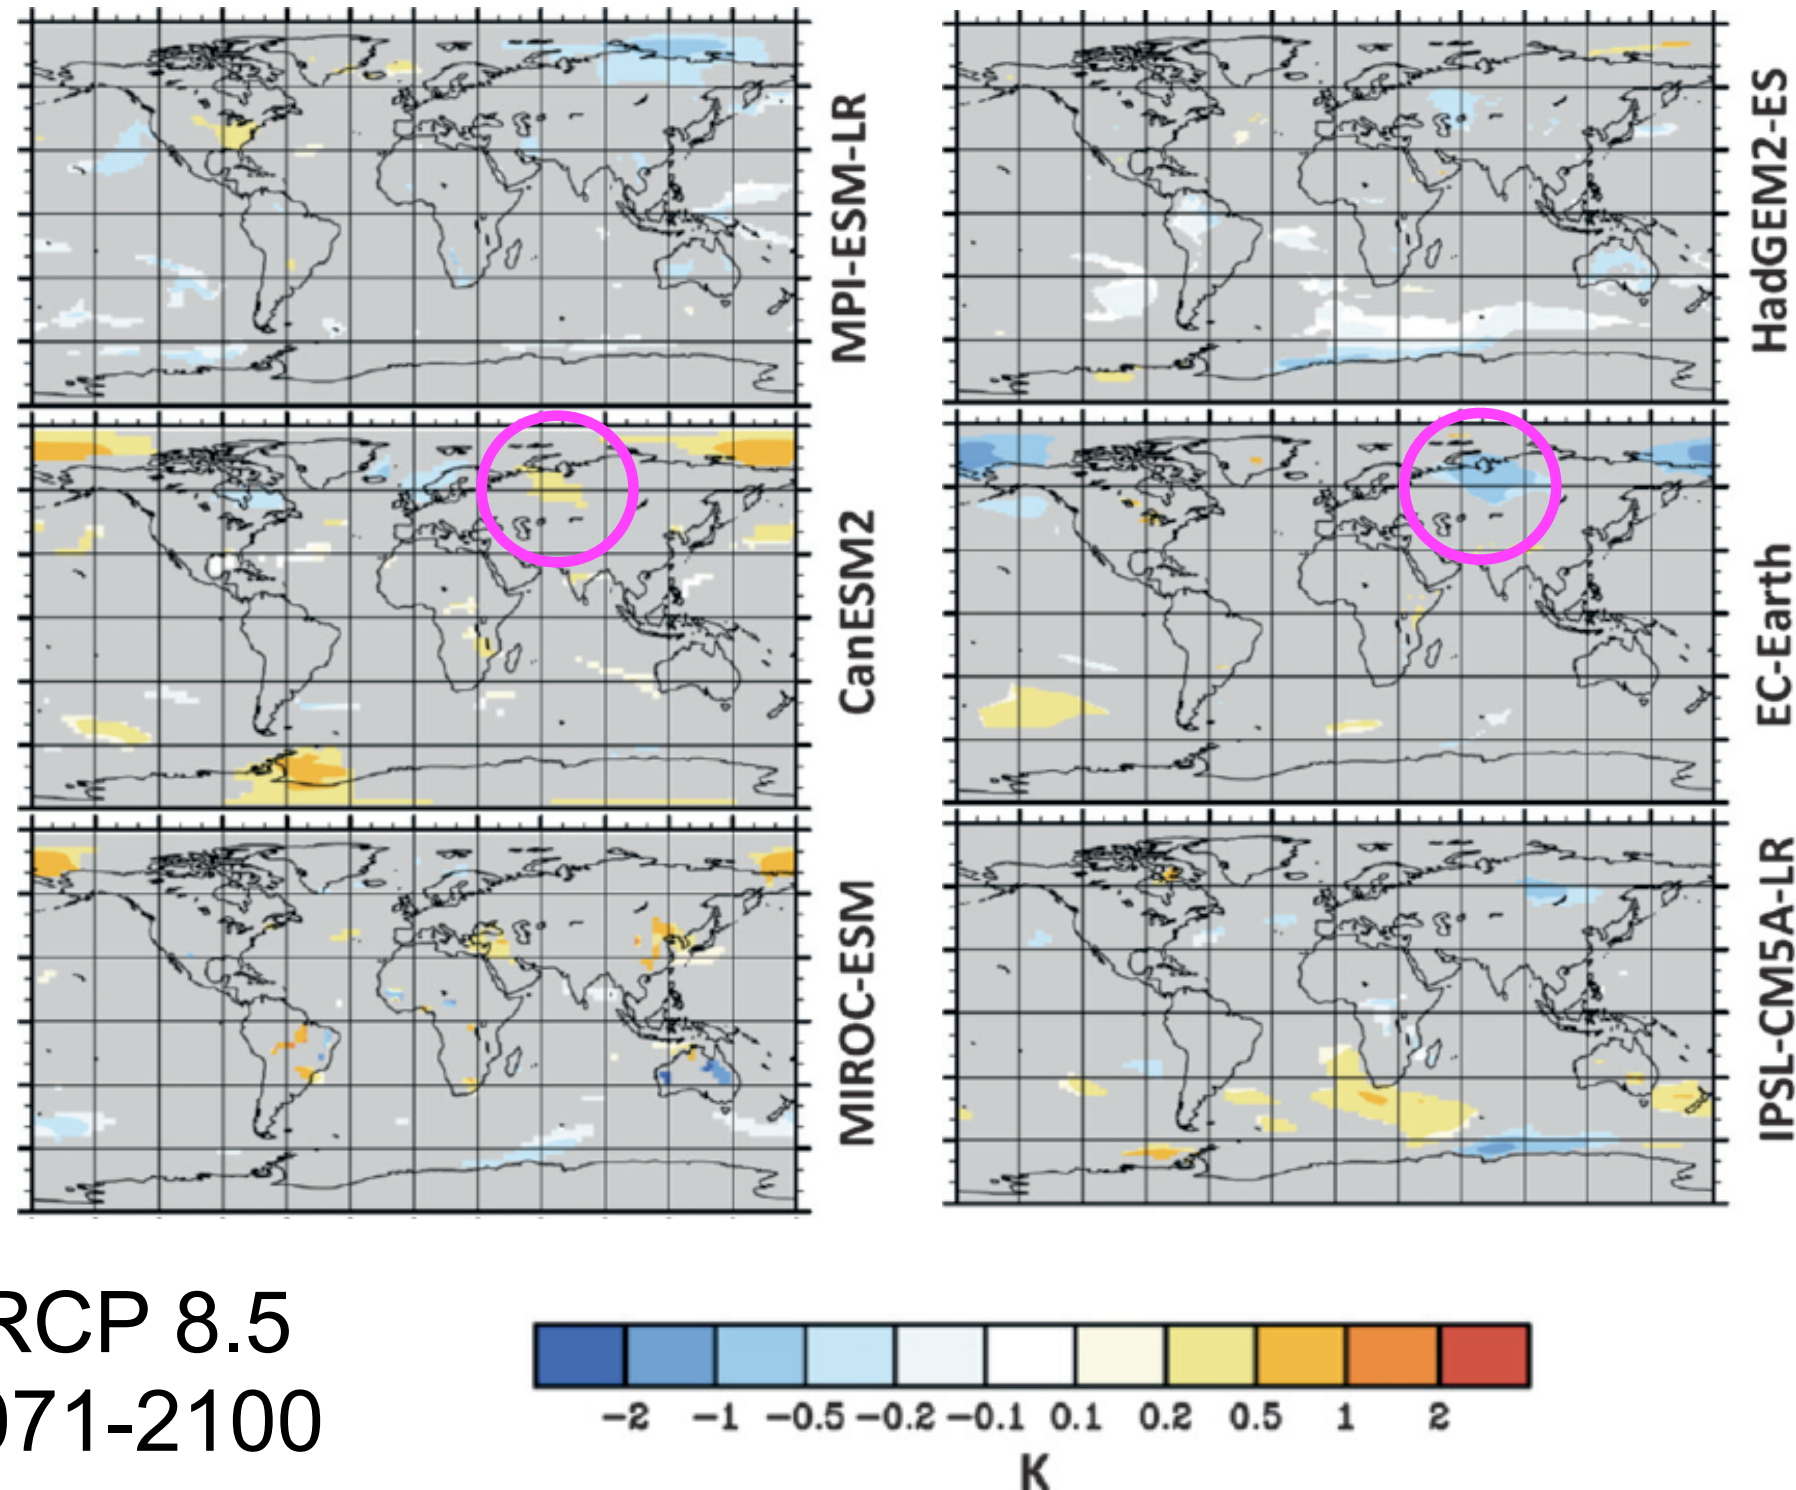

Land cover inconsistencies across IAMs and ESMs can alter the global carbon cycle

7

Different land use/cover representations in ESMs obscure land use change effects on regional climate

- Uncertainty chain:
 - IAM land use spatial uncertainty
 - Land use/cover translation
 - ESM land cover

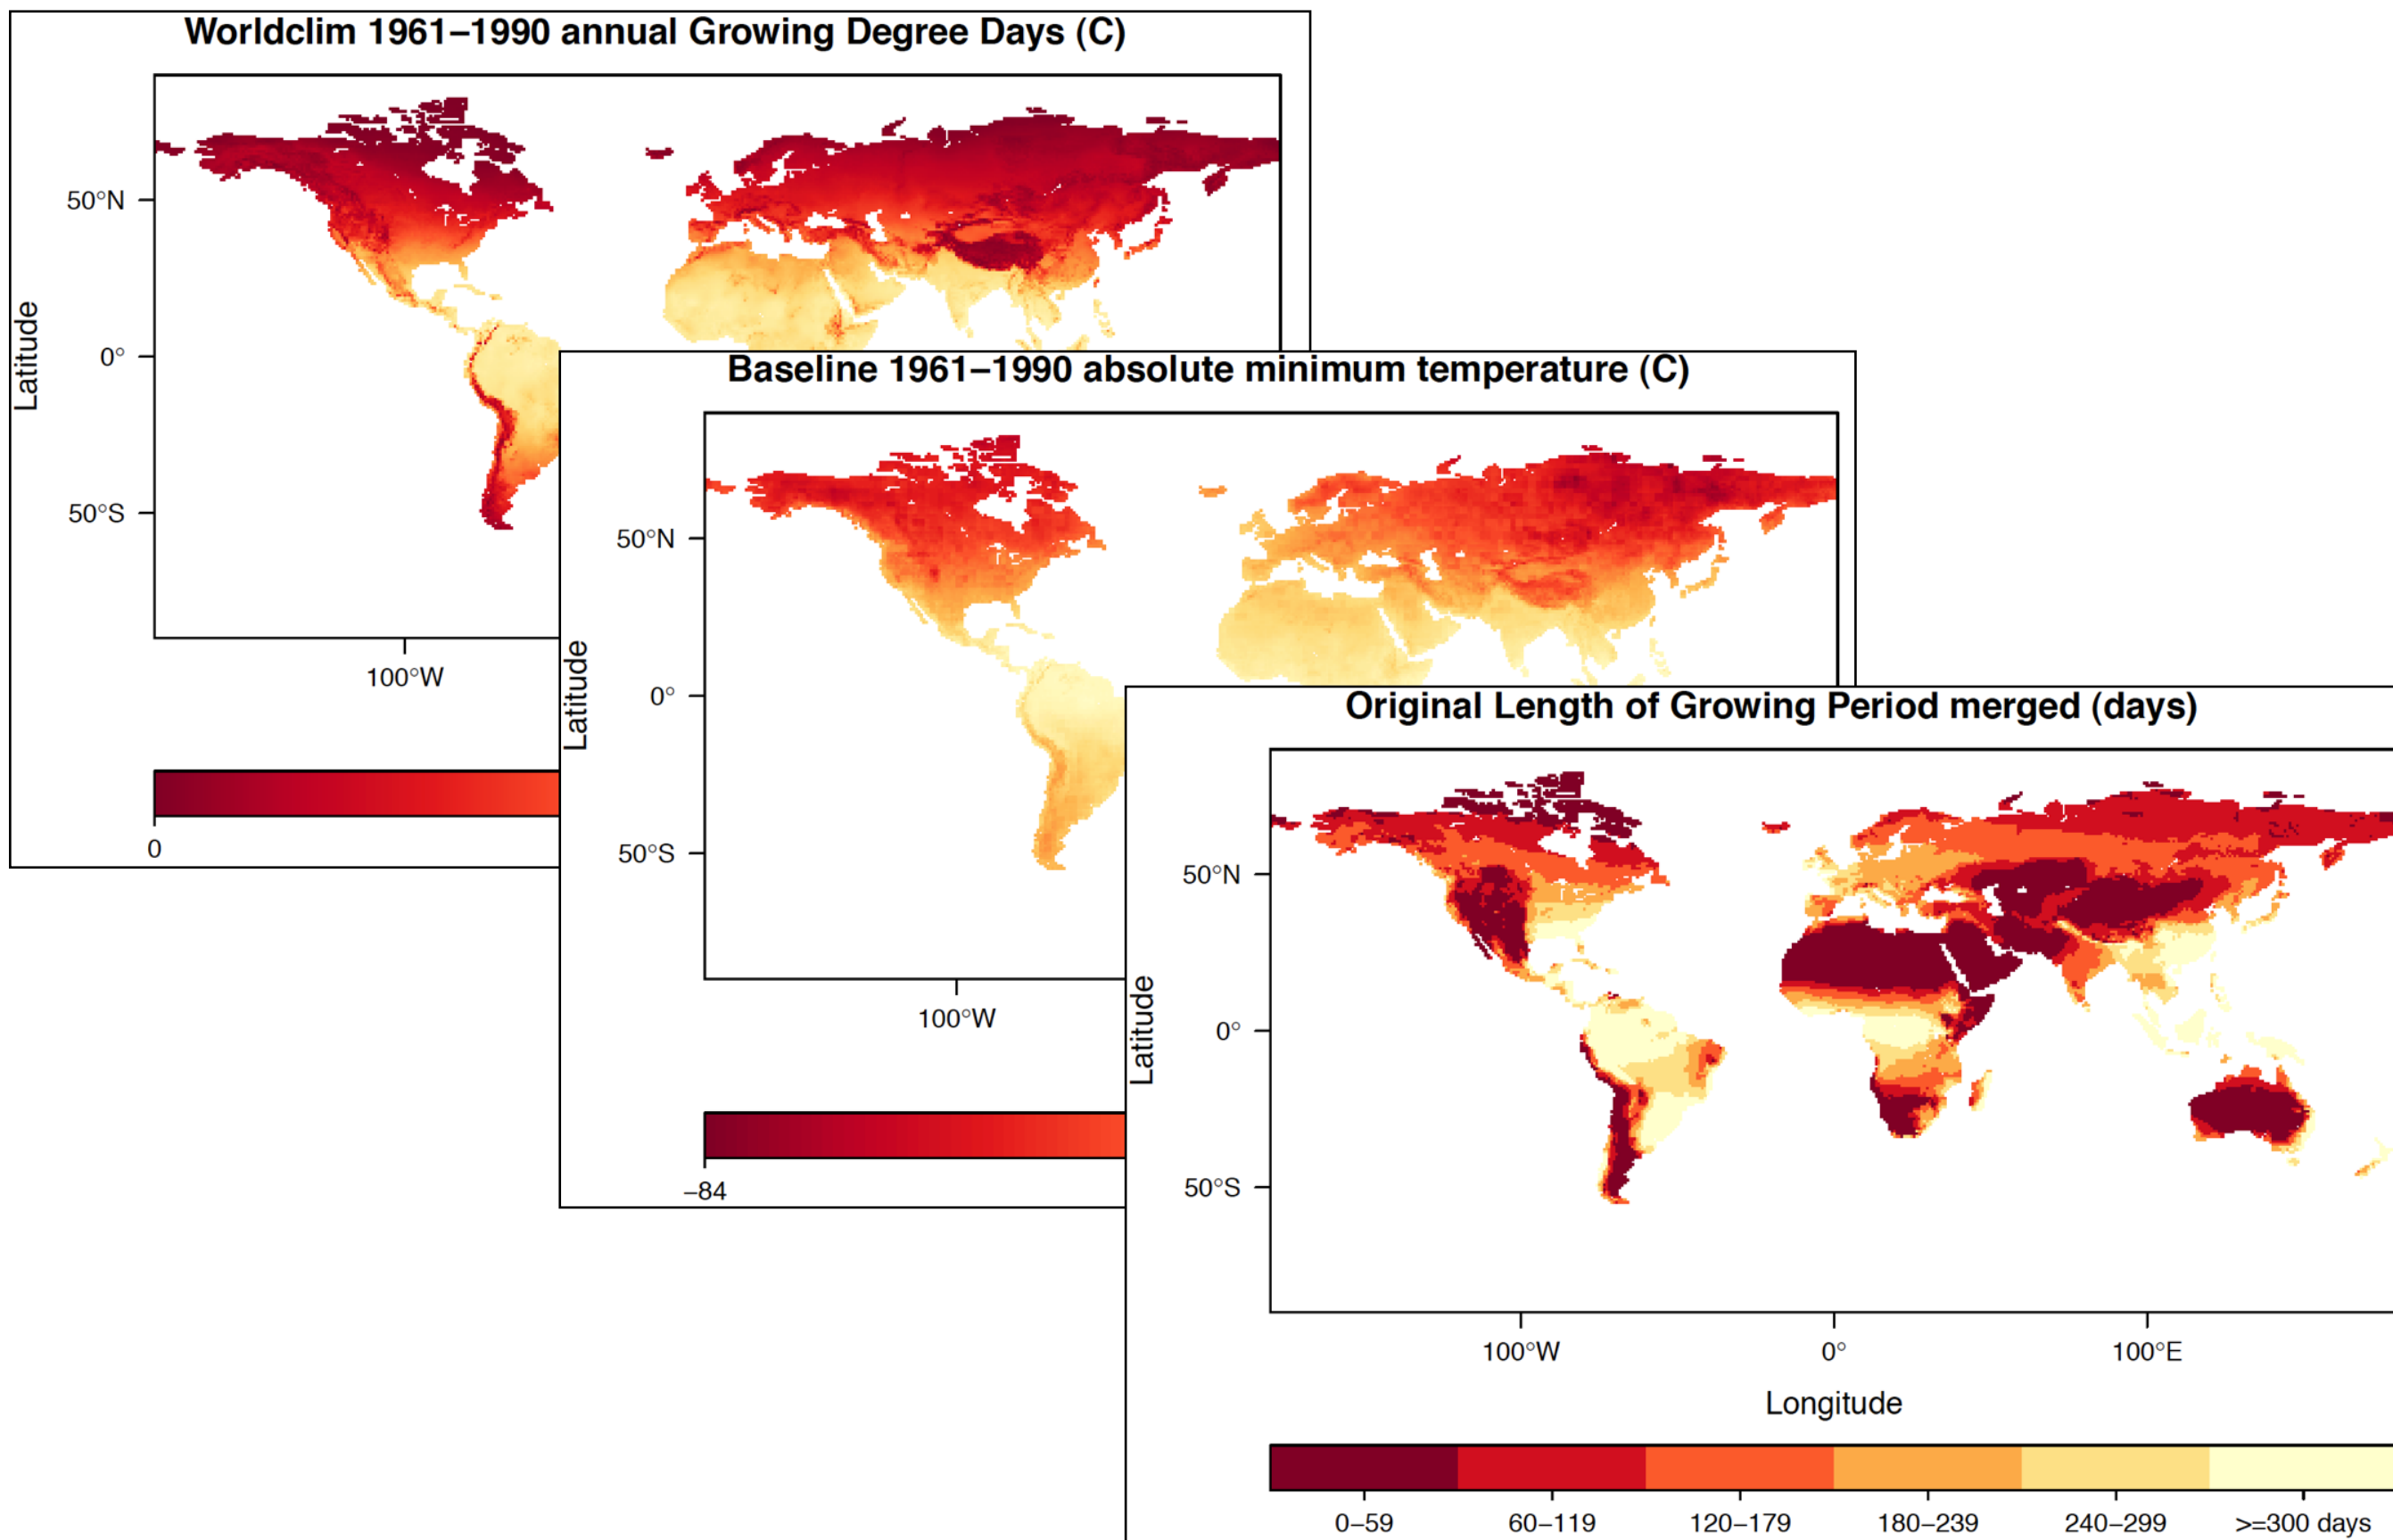

Temperature effect of RCP 8.5
land use change for 2071-2100
(Brovkin et al. 2013)

In the context of coupled whole earth system modeling

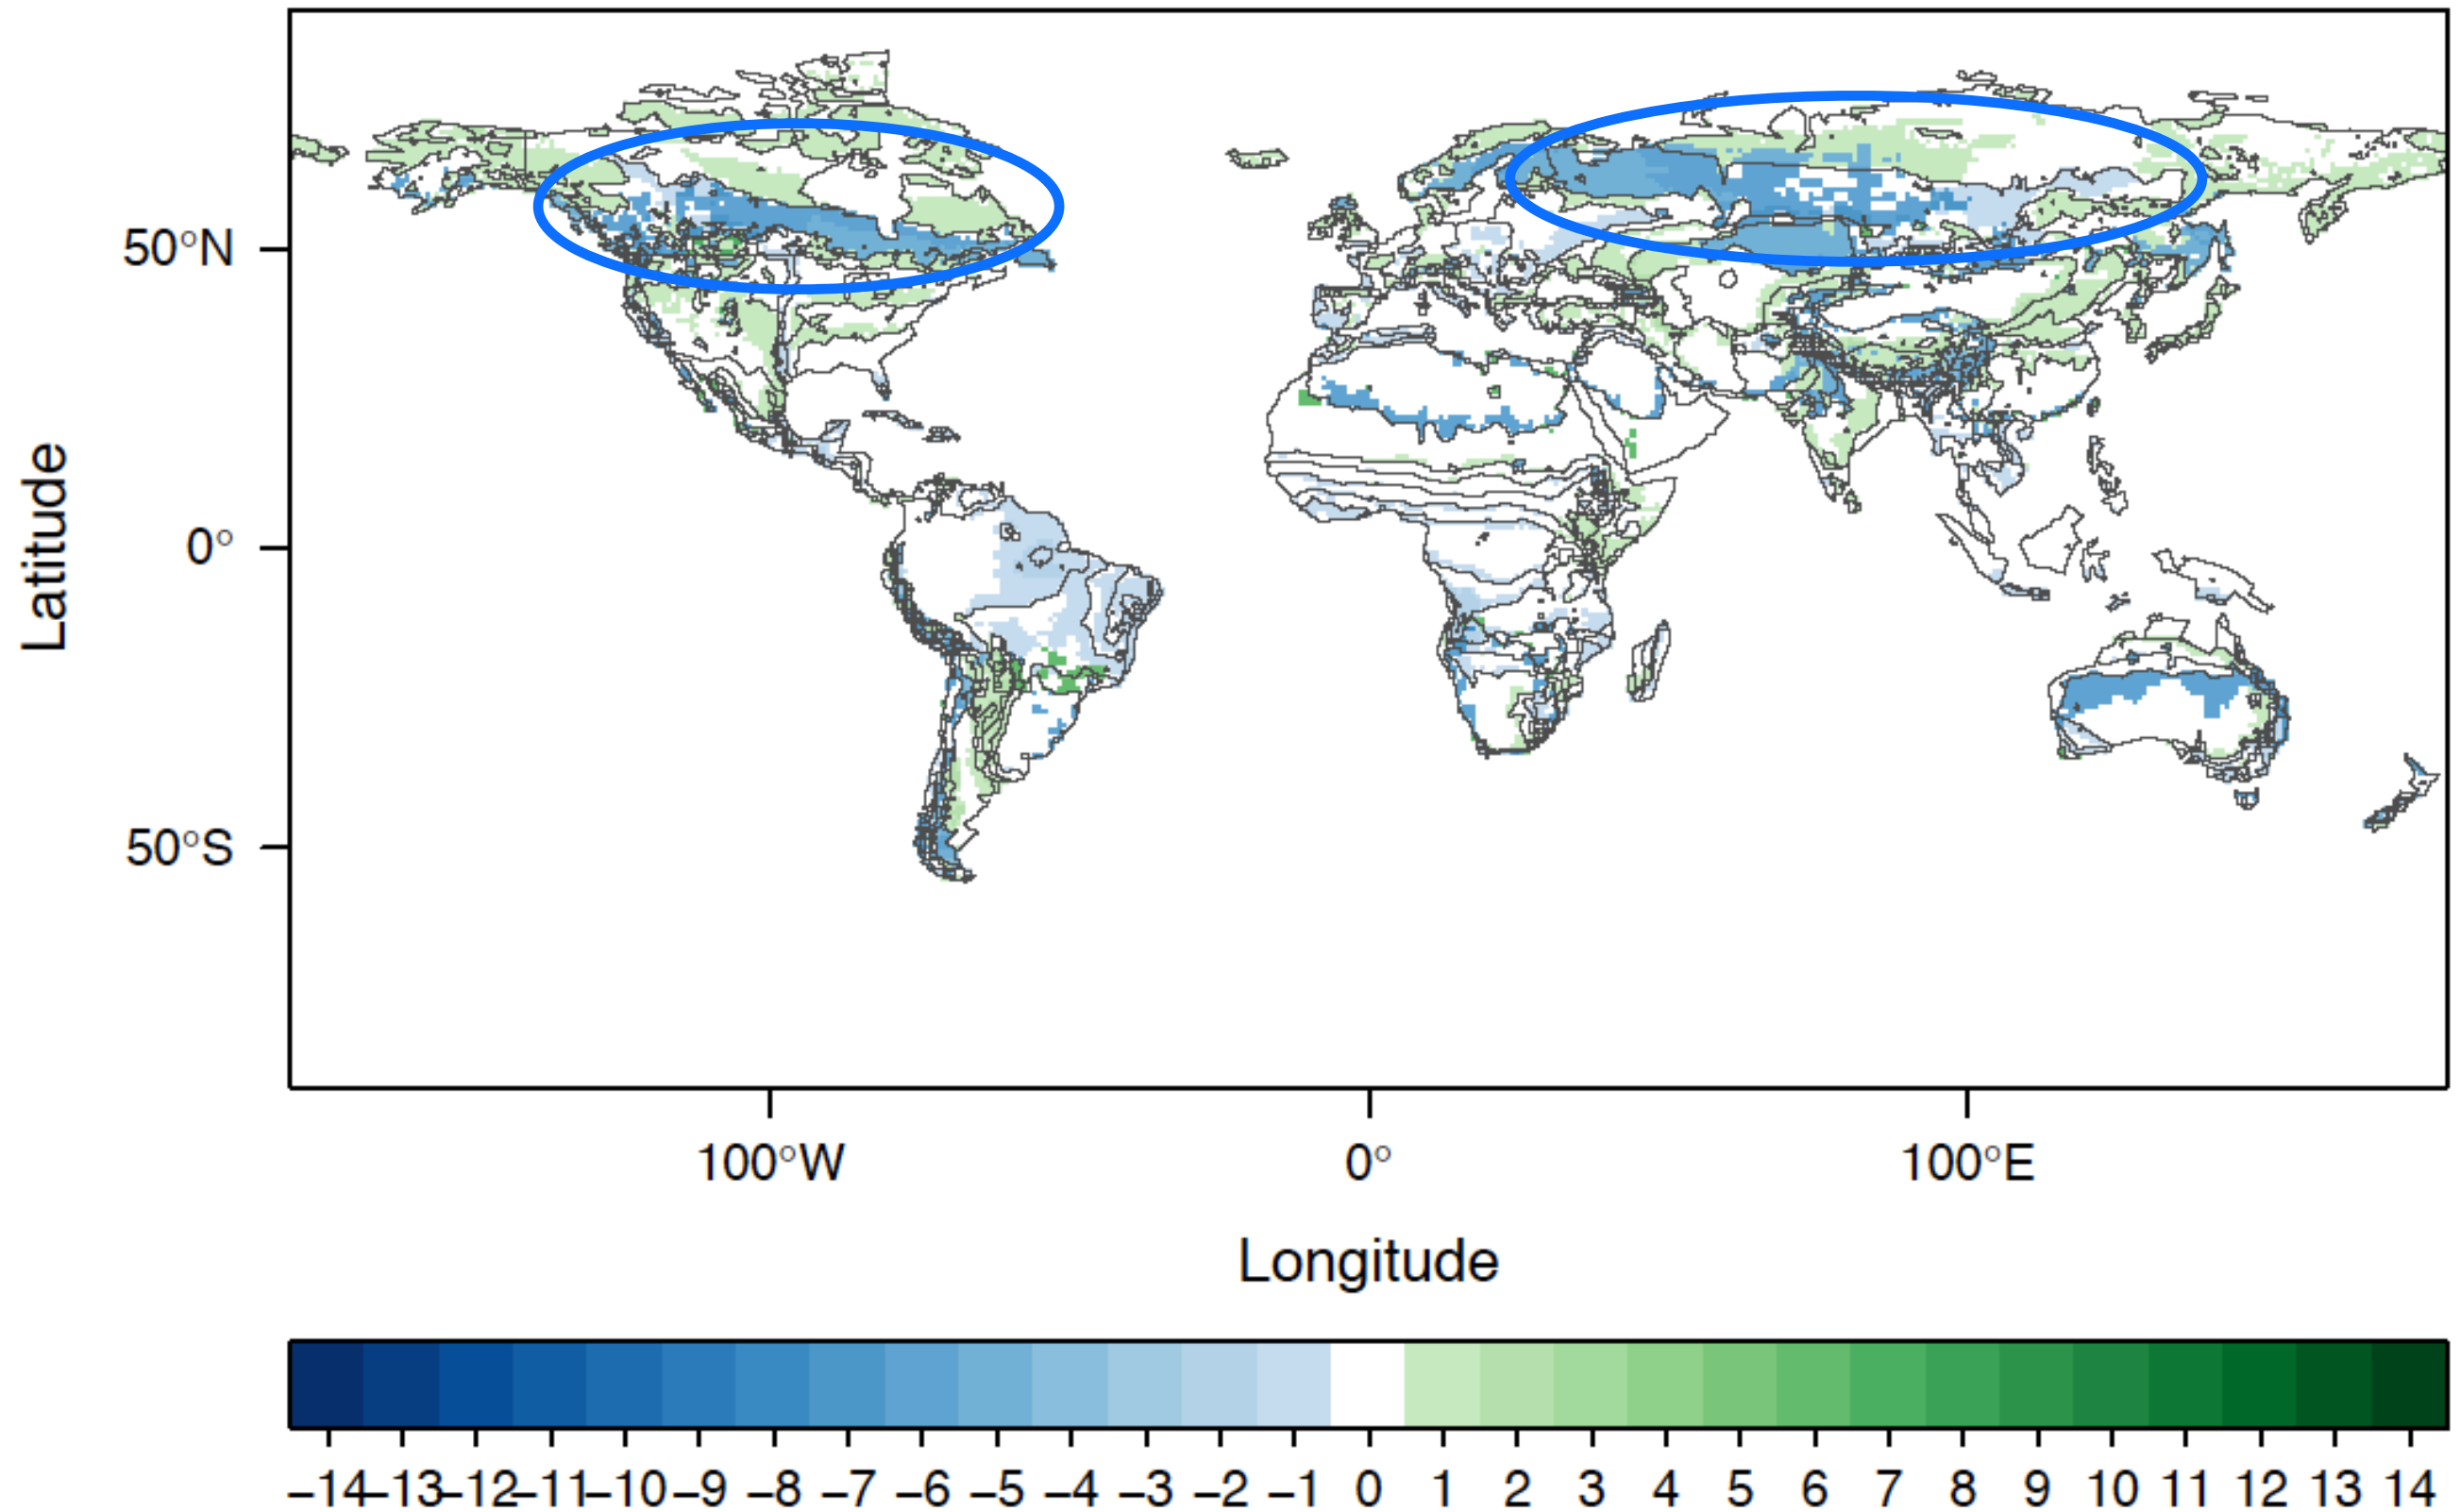

- How do we make robust projections of land use change in the context of projected climate change?
- **How do spatial boundaries influence projected land use?**

Agro-Ecological Zones (AEZs) are bio-climatically defined

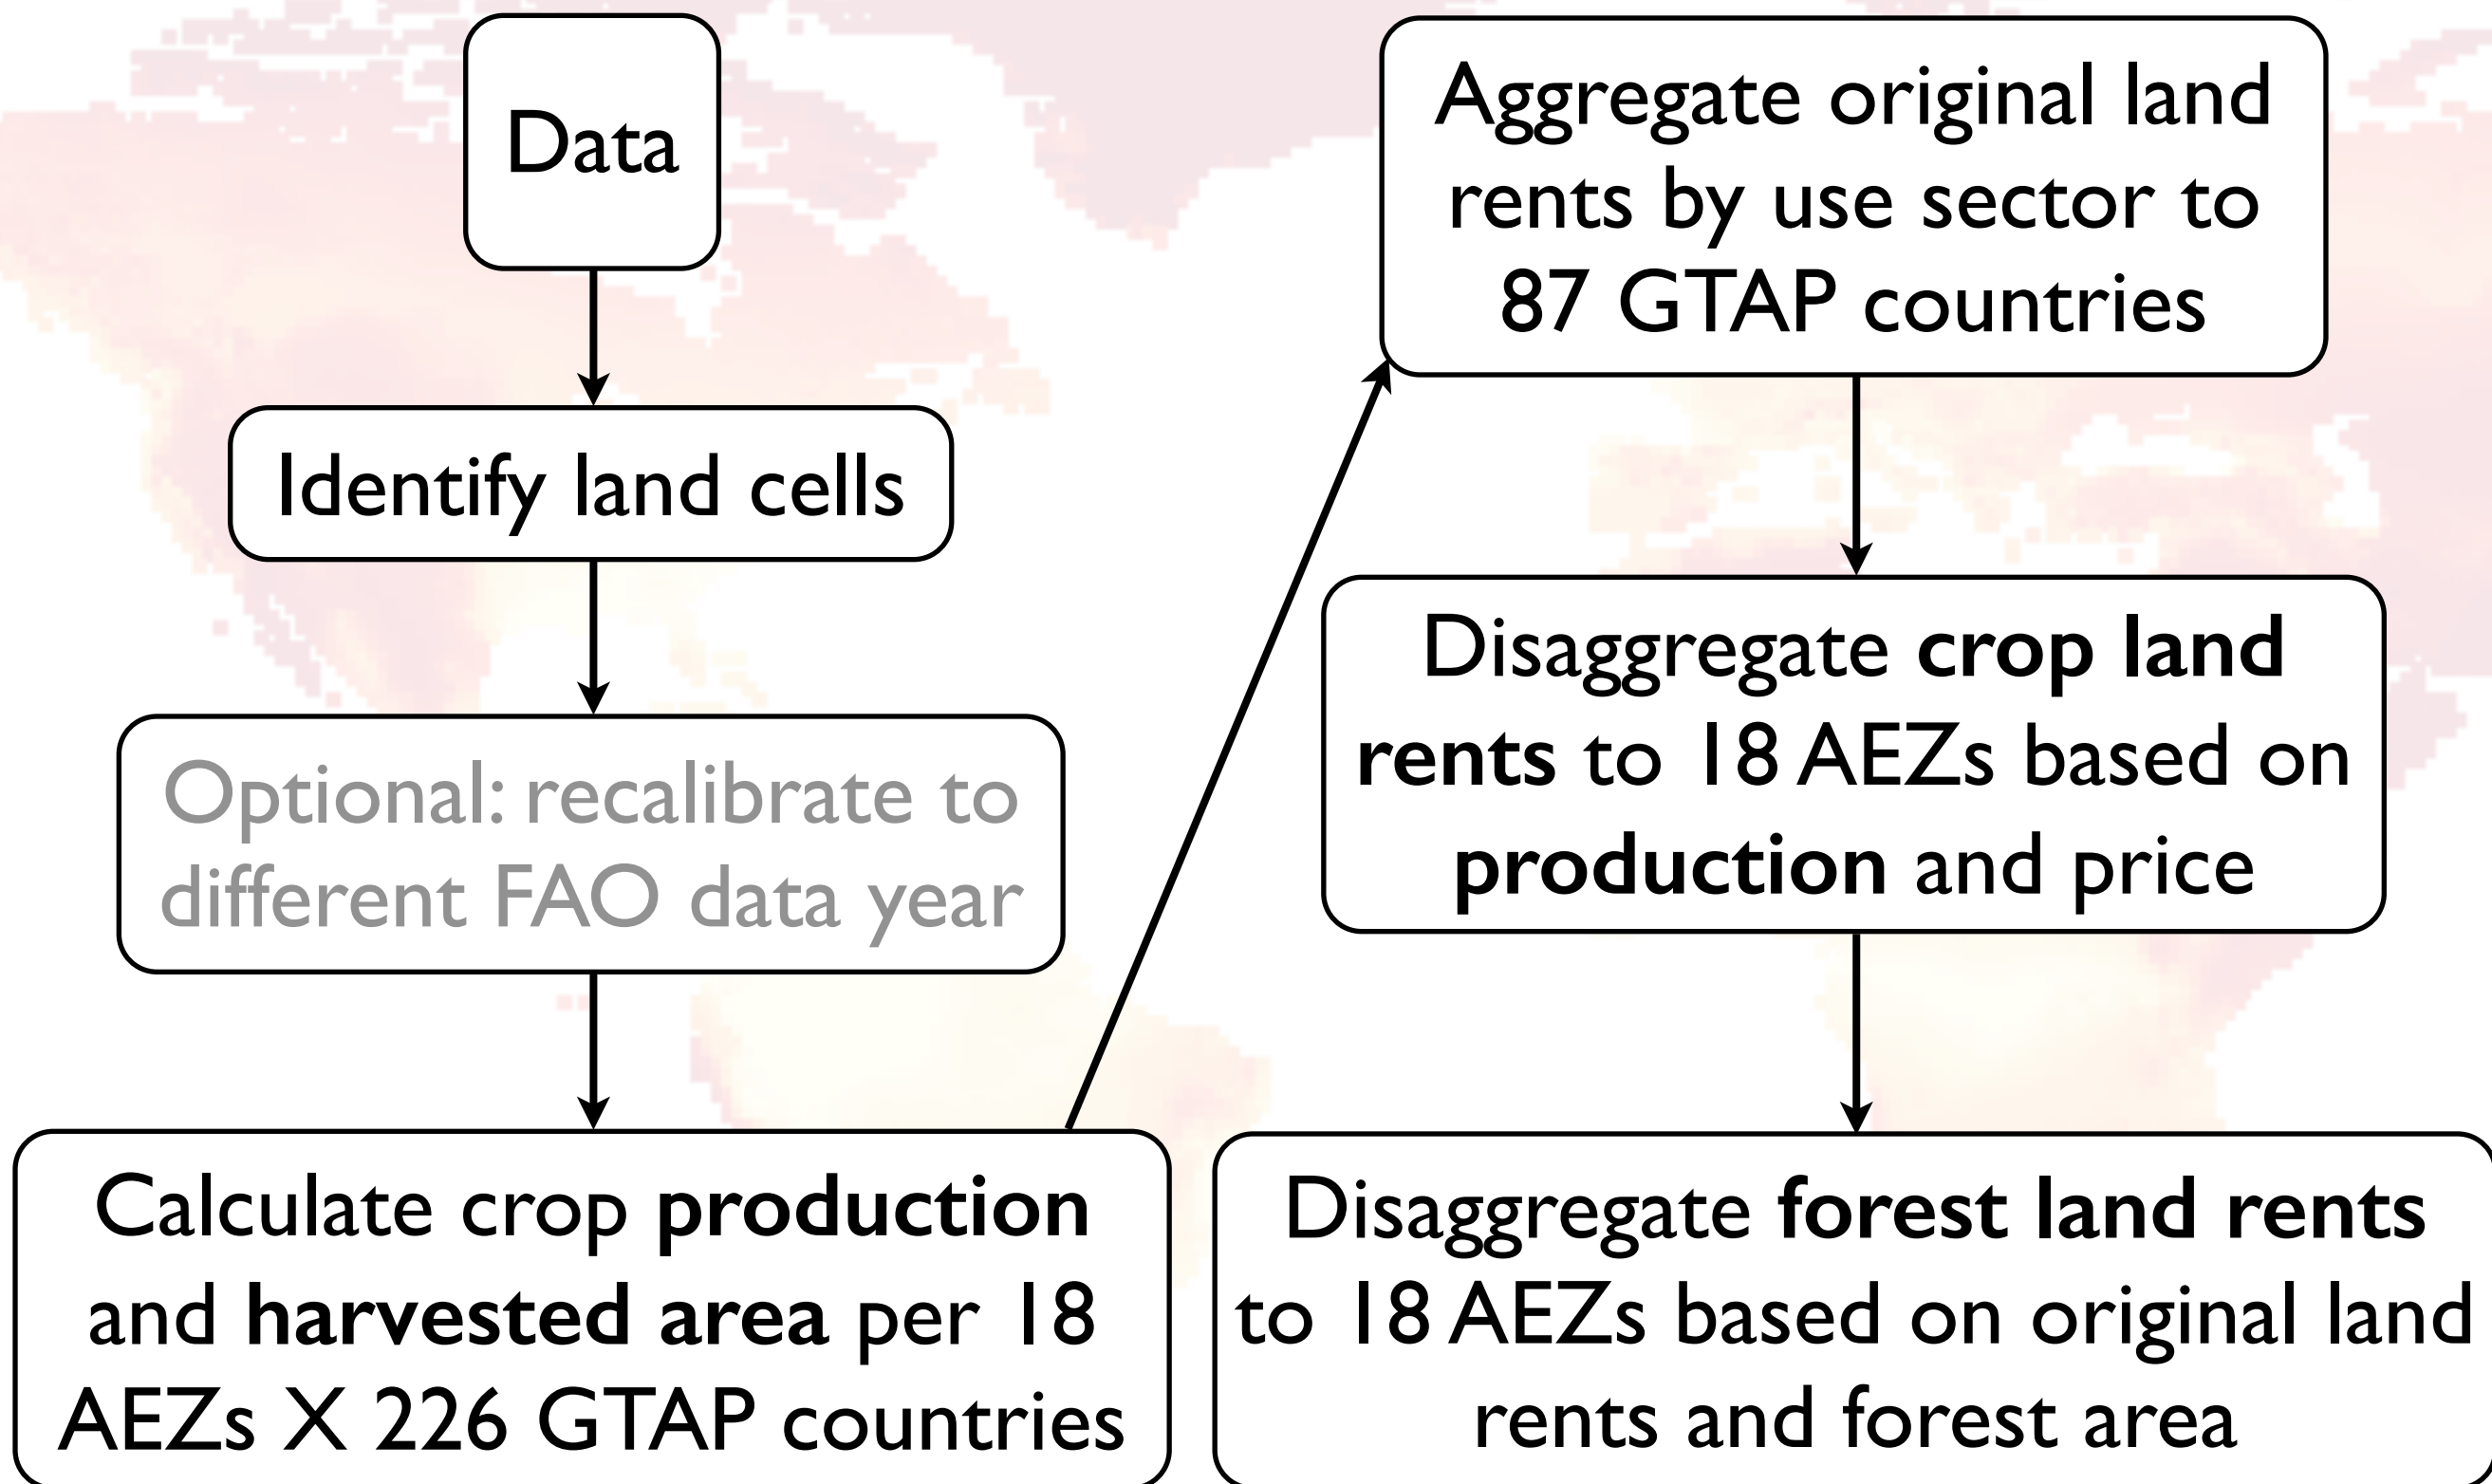

Current land units become heterogeneous

ECHAM 2100 AEZs – original baseline AEZs

Workflow to create new AgLU crop and land rent inputs

Data required to create new AgLU crop and land rent inputs

Spatially explicit data

- VMAP0 countries (246)
- AEZ countries (160)
- SAGE data:
 - crop yield, area
 - cropland
 - pasture
 - land area
 - potential vegetation
- HYDE3.1 data:
 - urban
 - land area
- AEZ boundaries

Tabular data

- GTAP countries (226, 87)
- FAO countries (241)
- GTAP (SAGE) crops
- GTAP use sector
- GTAP land rent
- FAO crops
- FAO crop production
- FAO producer prices
- FAO crop yield, area
 - for recalibration

Global distributions of Paddy Rice, by country

PaddyRice production cumulative distribution comparison

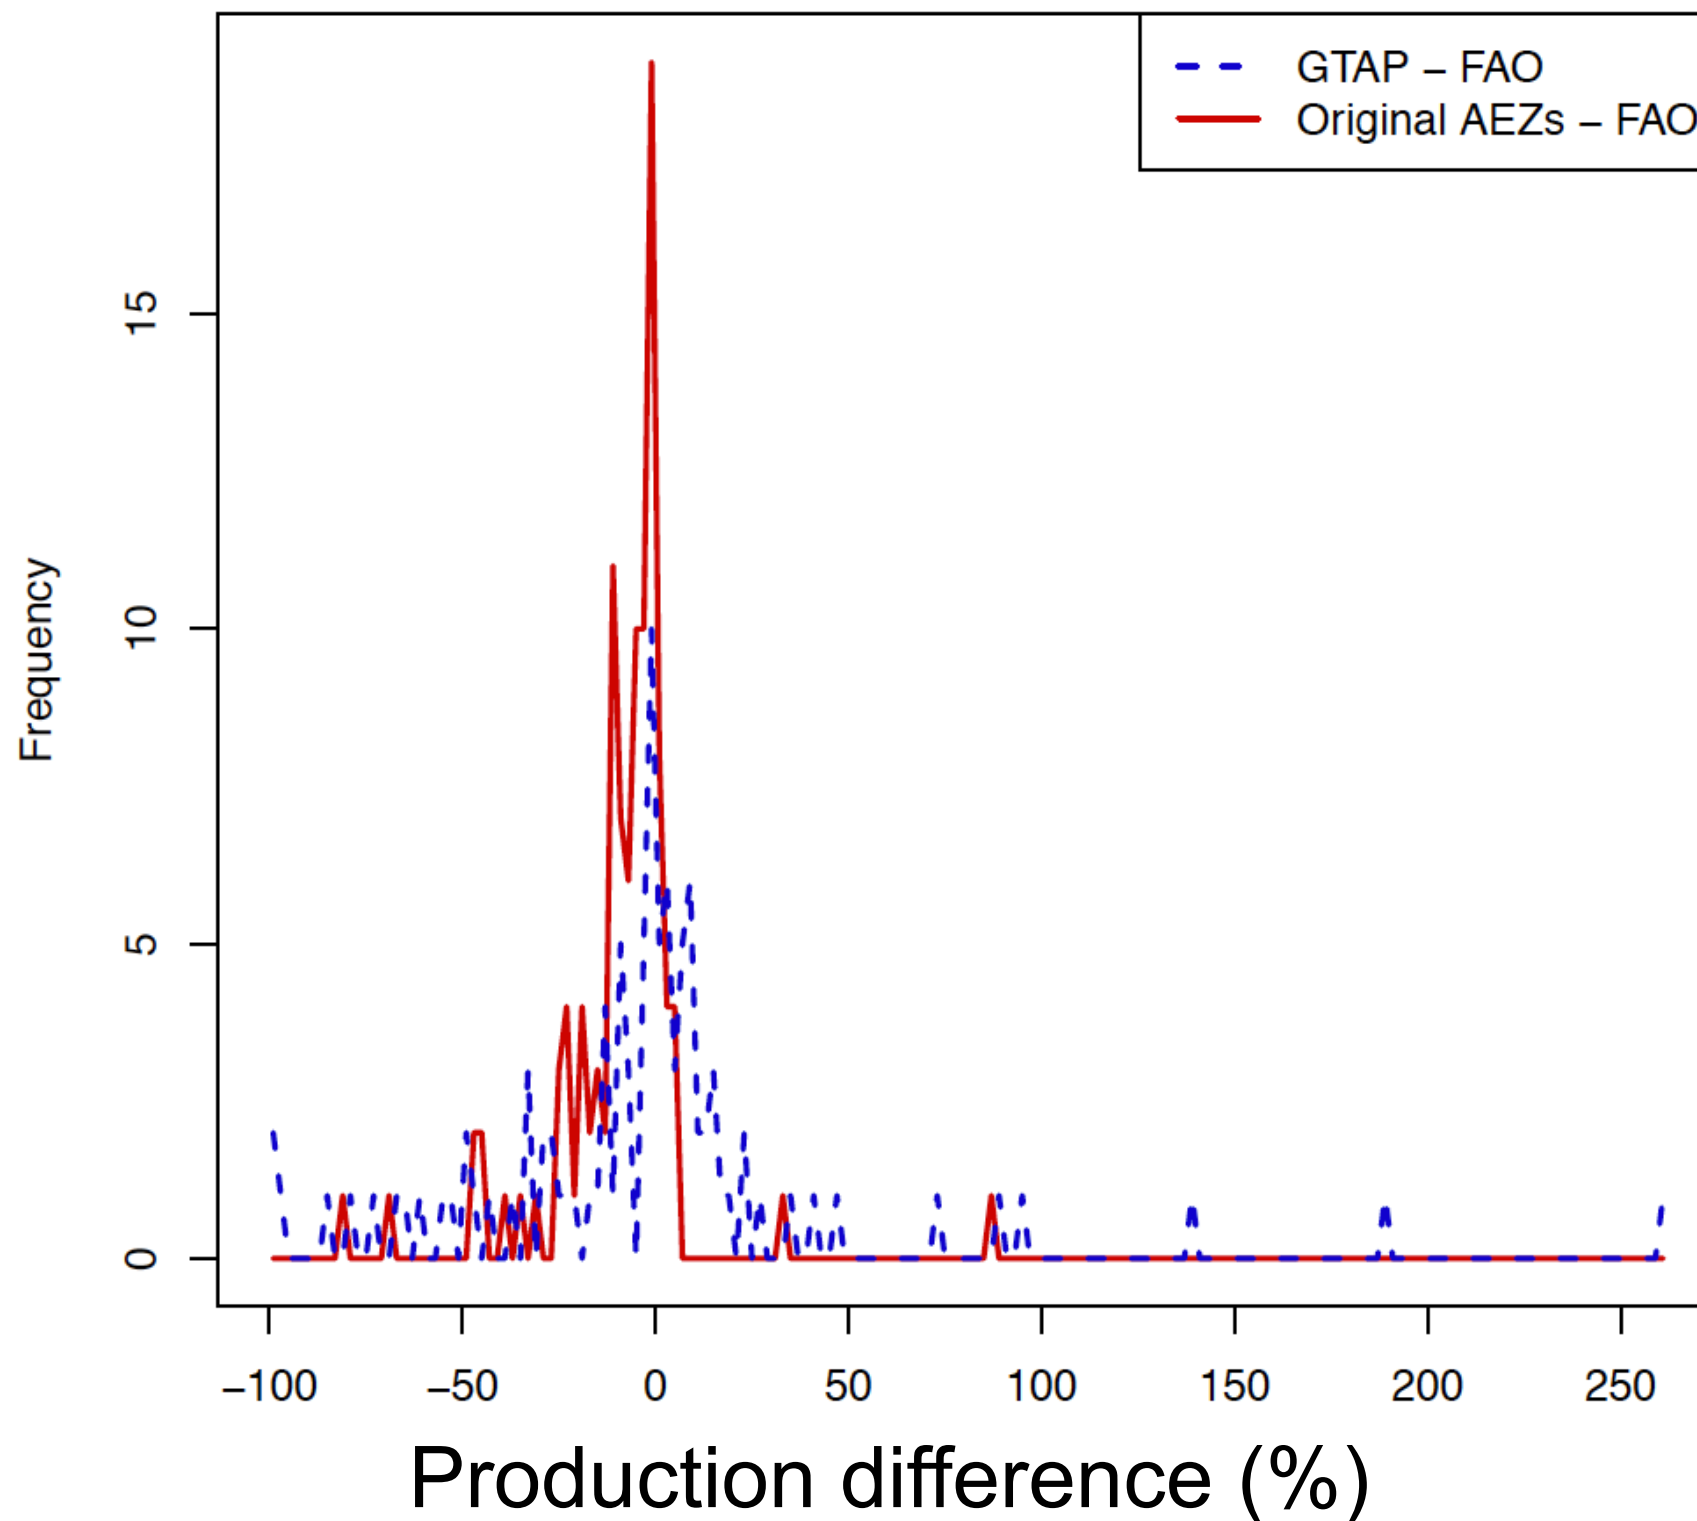

PaddyRice harvestd area cumulative distribution comparison

Distribution differences for Paddy Rice, by country

PaddyRice % production difference histogram comparison

Each crop is uniquely affected by new land units

Cumulative probability

Wheat production cumulative distribution comparison

PaddyRice production cumulative distribution comparison

OilPalmFruit production cumulative distribution comparison

Maize production cumulative distribution comparison

New AEZs
Original AEZs
GTAP

Production (t)

Global distributions of forest land rent, by GTAP land unit

Forestry land rent cumulative distribution comparison

Land Rent (US\$)

Forestry land rent cumulative distribution comparison

Land Rent (US\$)

Original AEZs

GTAP

New AEZs

AEZ boundaries affect projected land use/cover

Russia (new minus old)

AEZ boundaries affect projected land use/cover

Central Asia (new minus old)

AEZ boundaries affect projected land use/cover

Northern South America (new minus old)

Summary

- AEZ-based land units do not consistently meet homogeneity assumption for land use projection
- New software performs better than GTAP with respect to FAO data: Reproducibility?
- Global distributions of crop production, harvested area, and forest land rent are different between the original and new land units
- Regional land use/cover distributions are different between the original and new land units
- Feedbacks: climate, impact, and land use

Summary

- AEZ-based land units do not consistently meet homogeneity assumption for land use projection
- New software performs better than GTAP with respect to FAO data: Reproducibility?
- Global distributions of crop production, harvested area, and forest land rent are different between the original and new land units
- Regional land use/cover distributions are different between the original and new land units
- Feedbacks: climate, impact, and land use

Summary

- AEZ-based land units do not consistently meet homogeneity assumption for land use projection
- New software performs better than GTAP with respect to FAO data: Reproducibility?
- **Global distributions of crop production, harvested area, and forest land rent are different between the original and new land units**
- Regional land use/cover distributions are different between the original and new land units
- Feedbacks: climate, impact, and land use

Summary

Summary

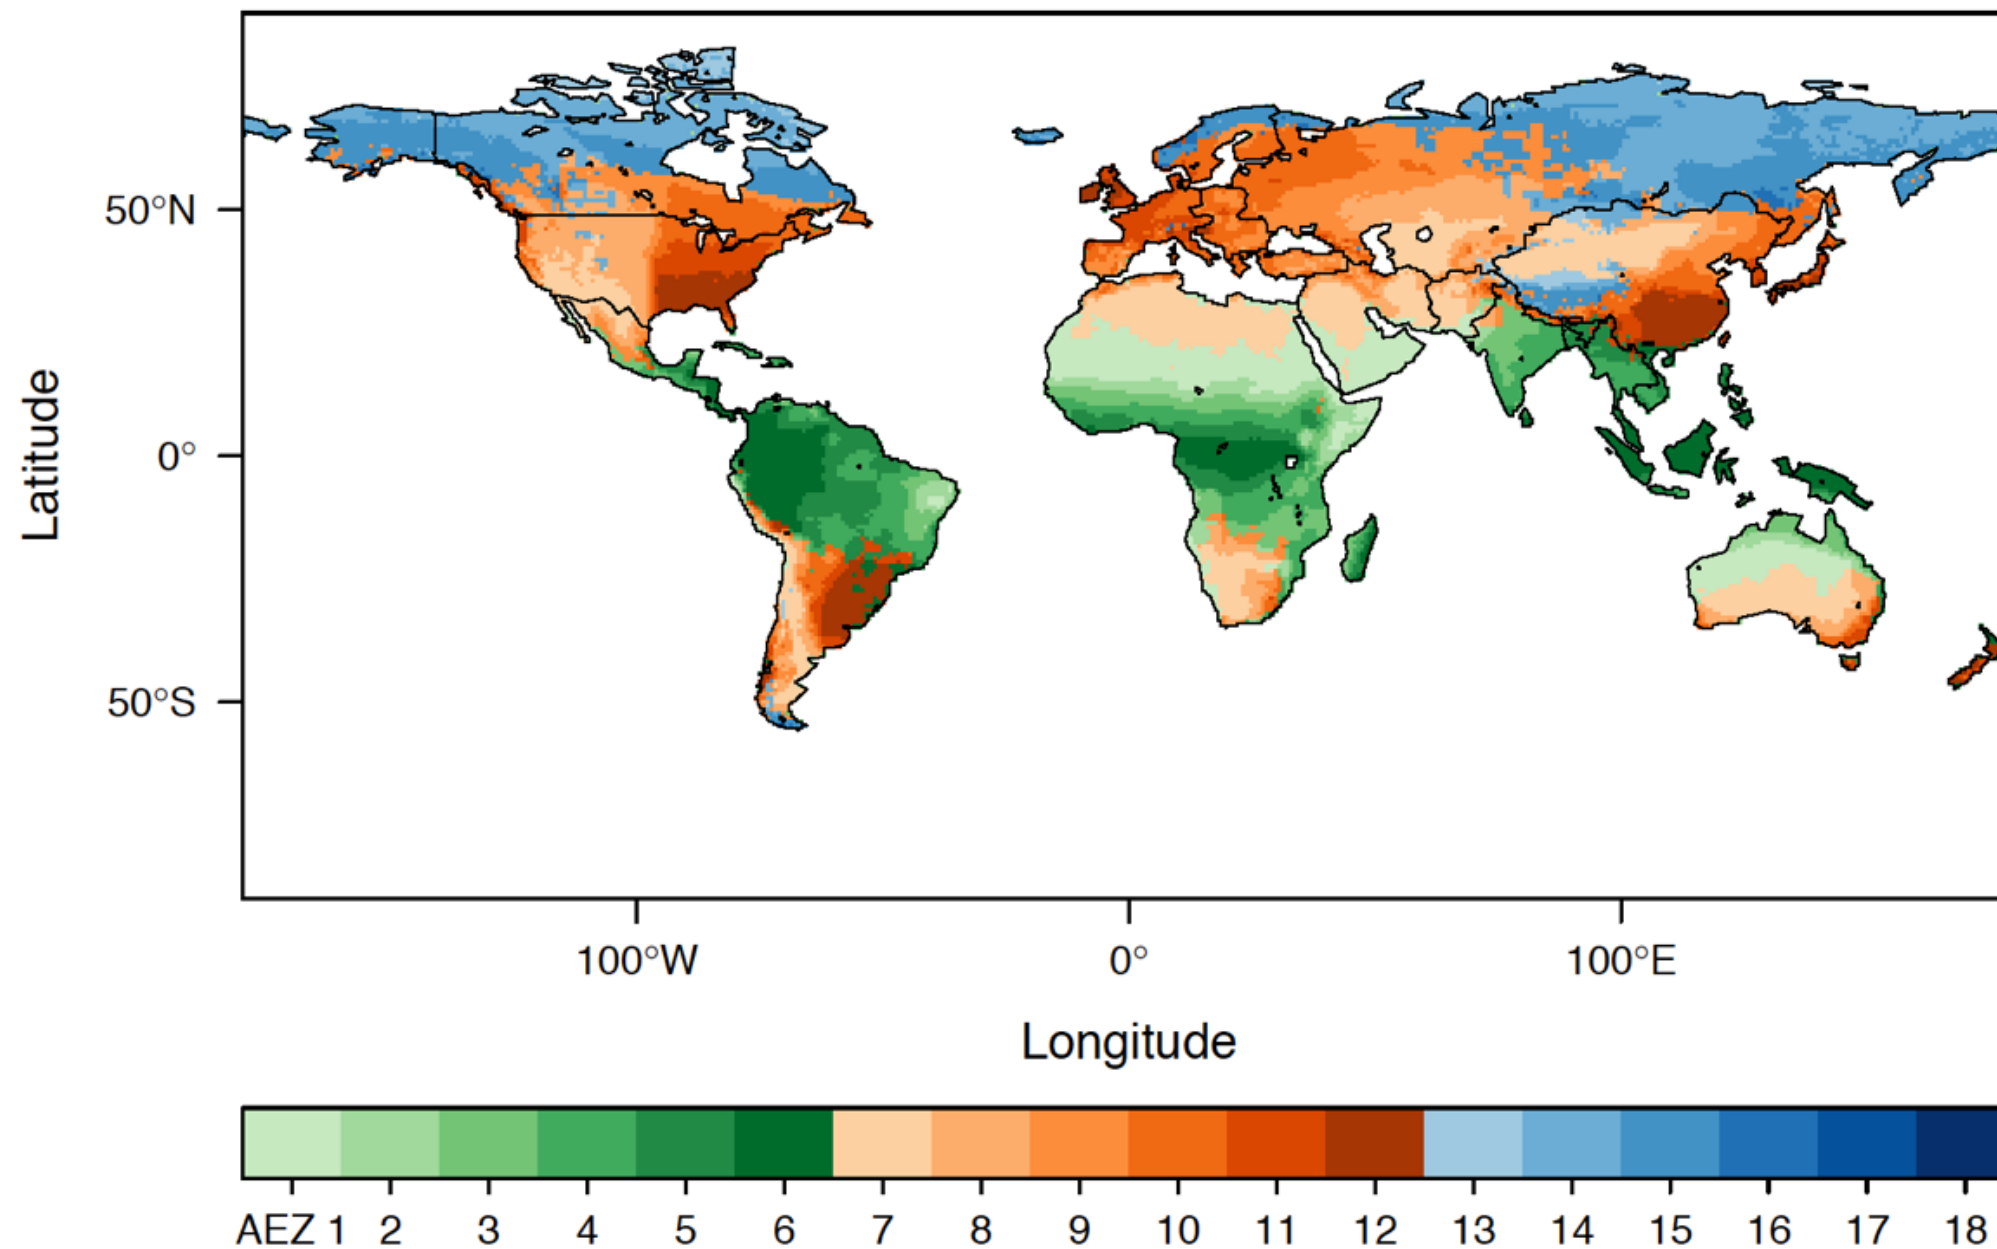

- AEZ-based land units do not consistently meet homogeneity assumption for land use projection
- New software performs better than GTAP with respect to FAO data: Reproducibility?
- Global distributions of crop production, harvested area, and forest land rent are different between the original and new land units
- Regional land use/cover distributions are different between the original and new land units
- **Feedbacks: climate, impact, and land use**

Opportunities

- Optimize GCAM land units
- New spatial land delineation
 - AgLU coincides with water module?
 - AEZ x watershed?
- Facilitate spatial data consistency across global models

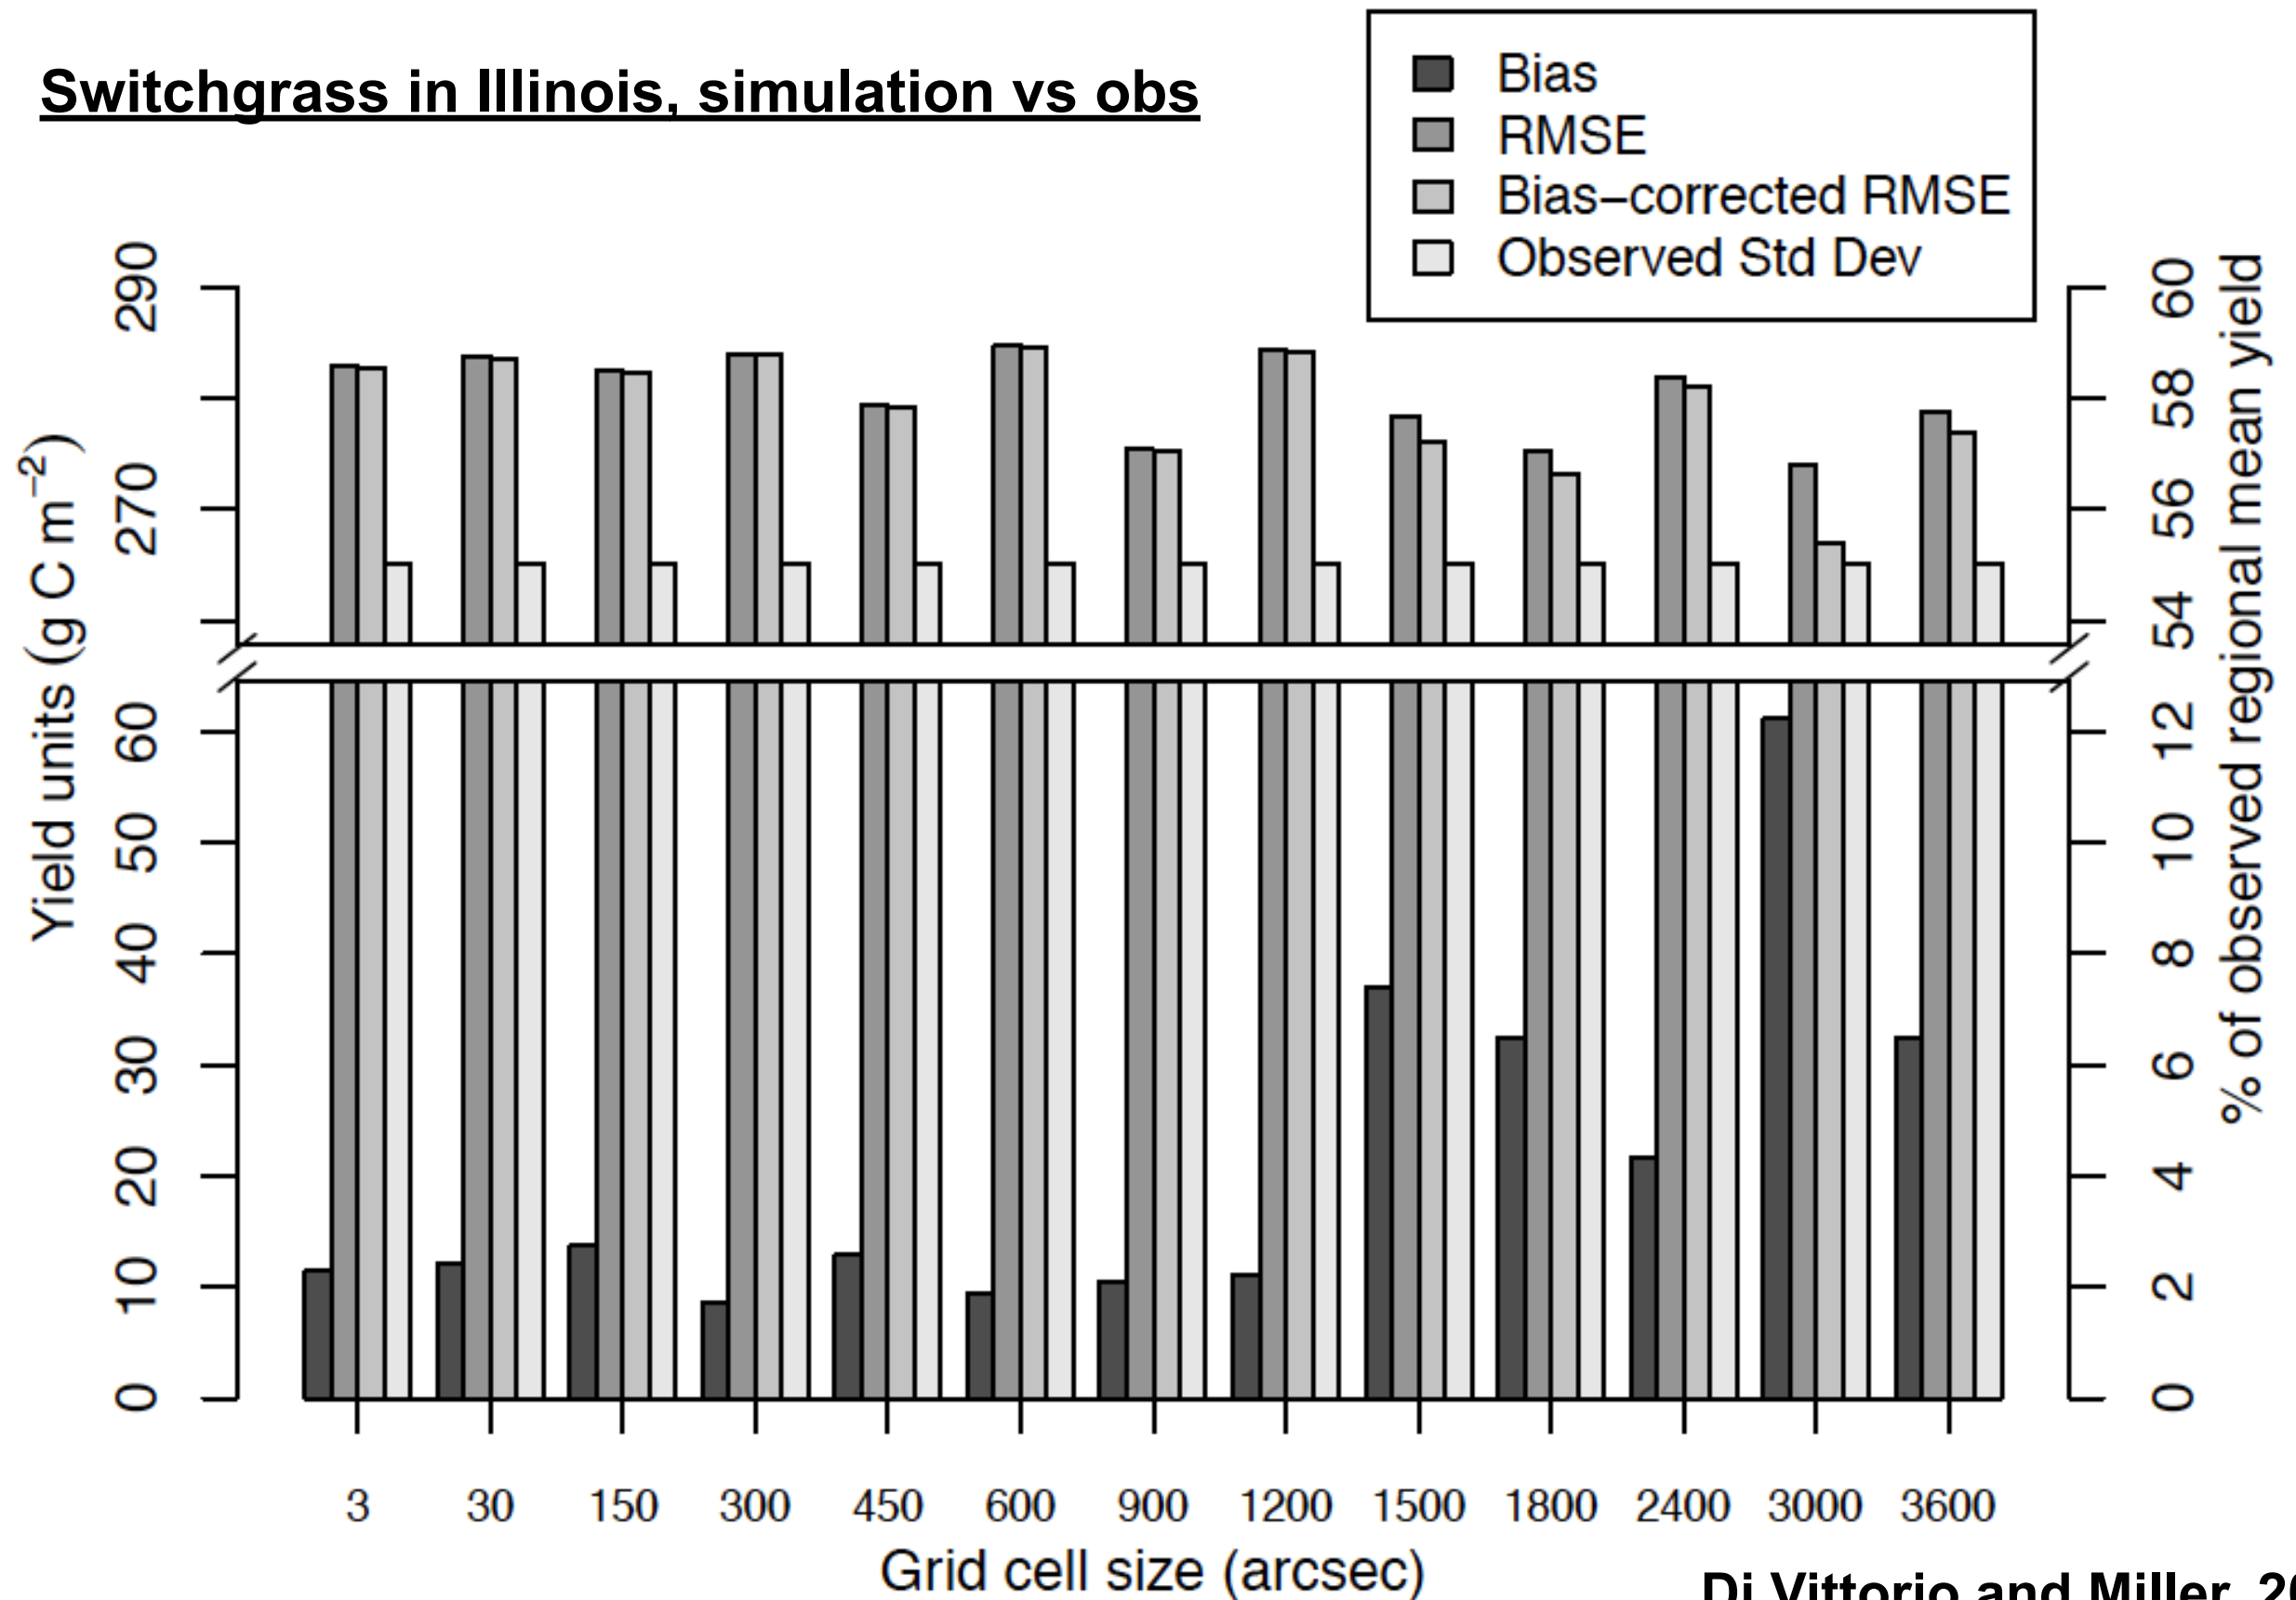

Questions?

ECHAM 2071–2100 climate agro-ecological zones

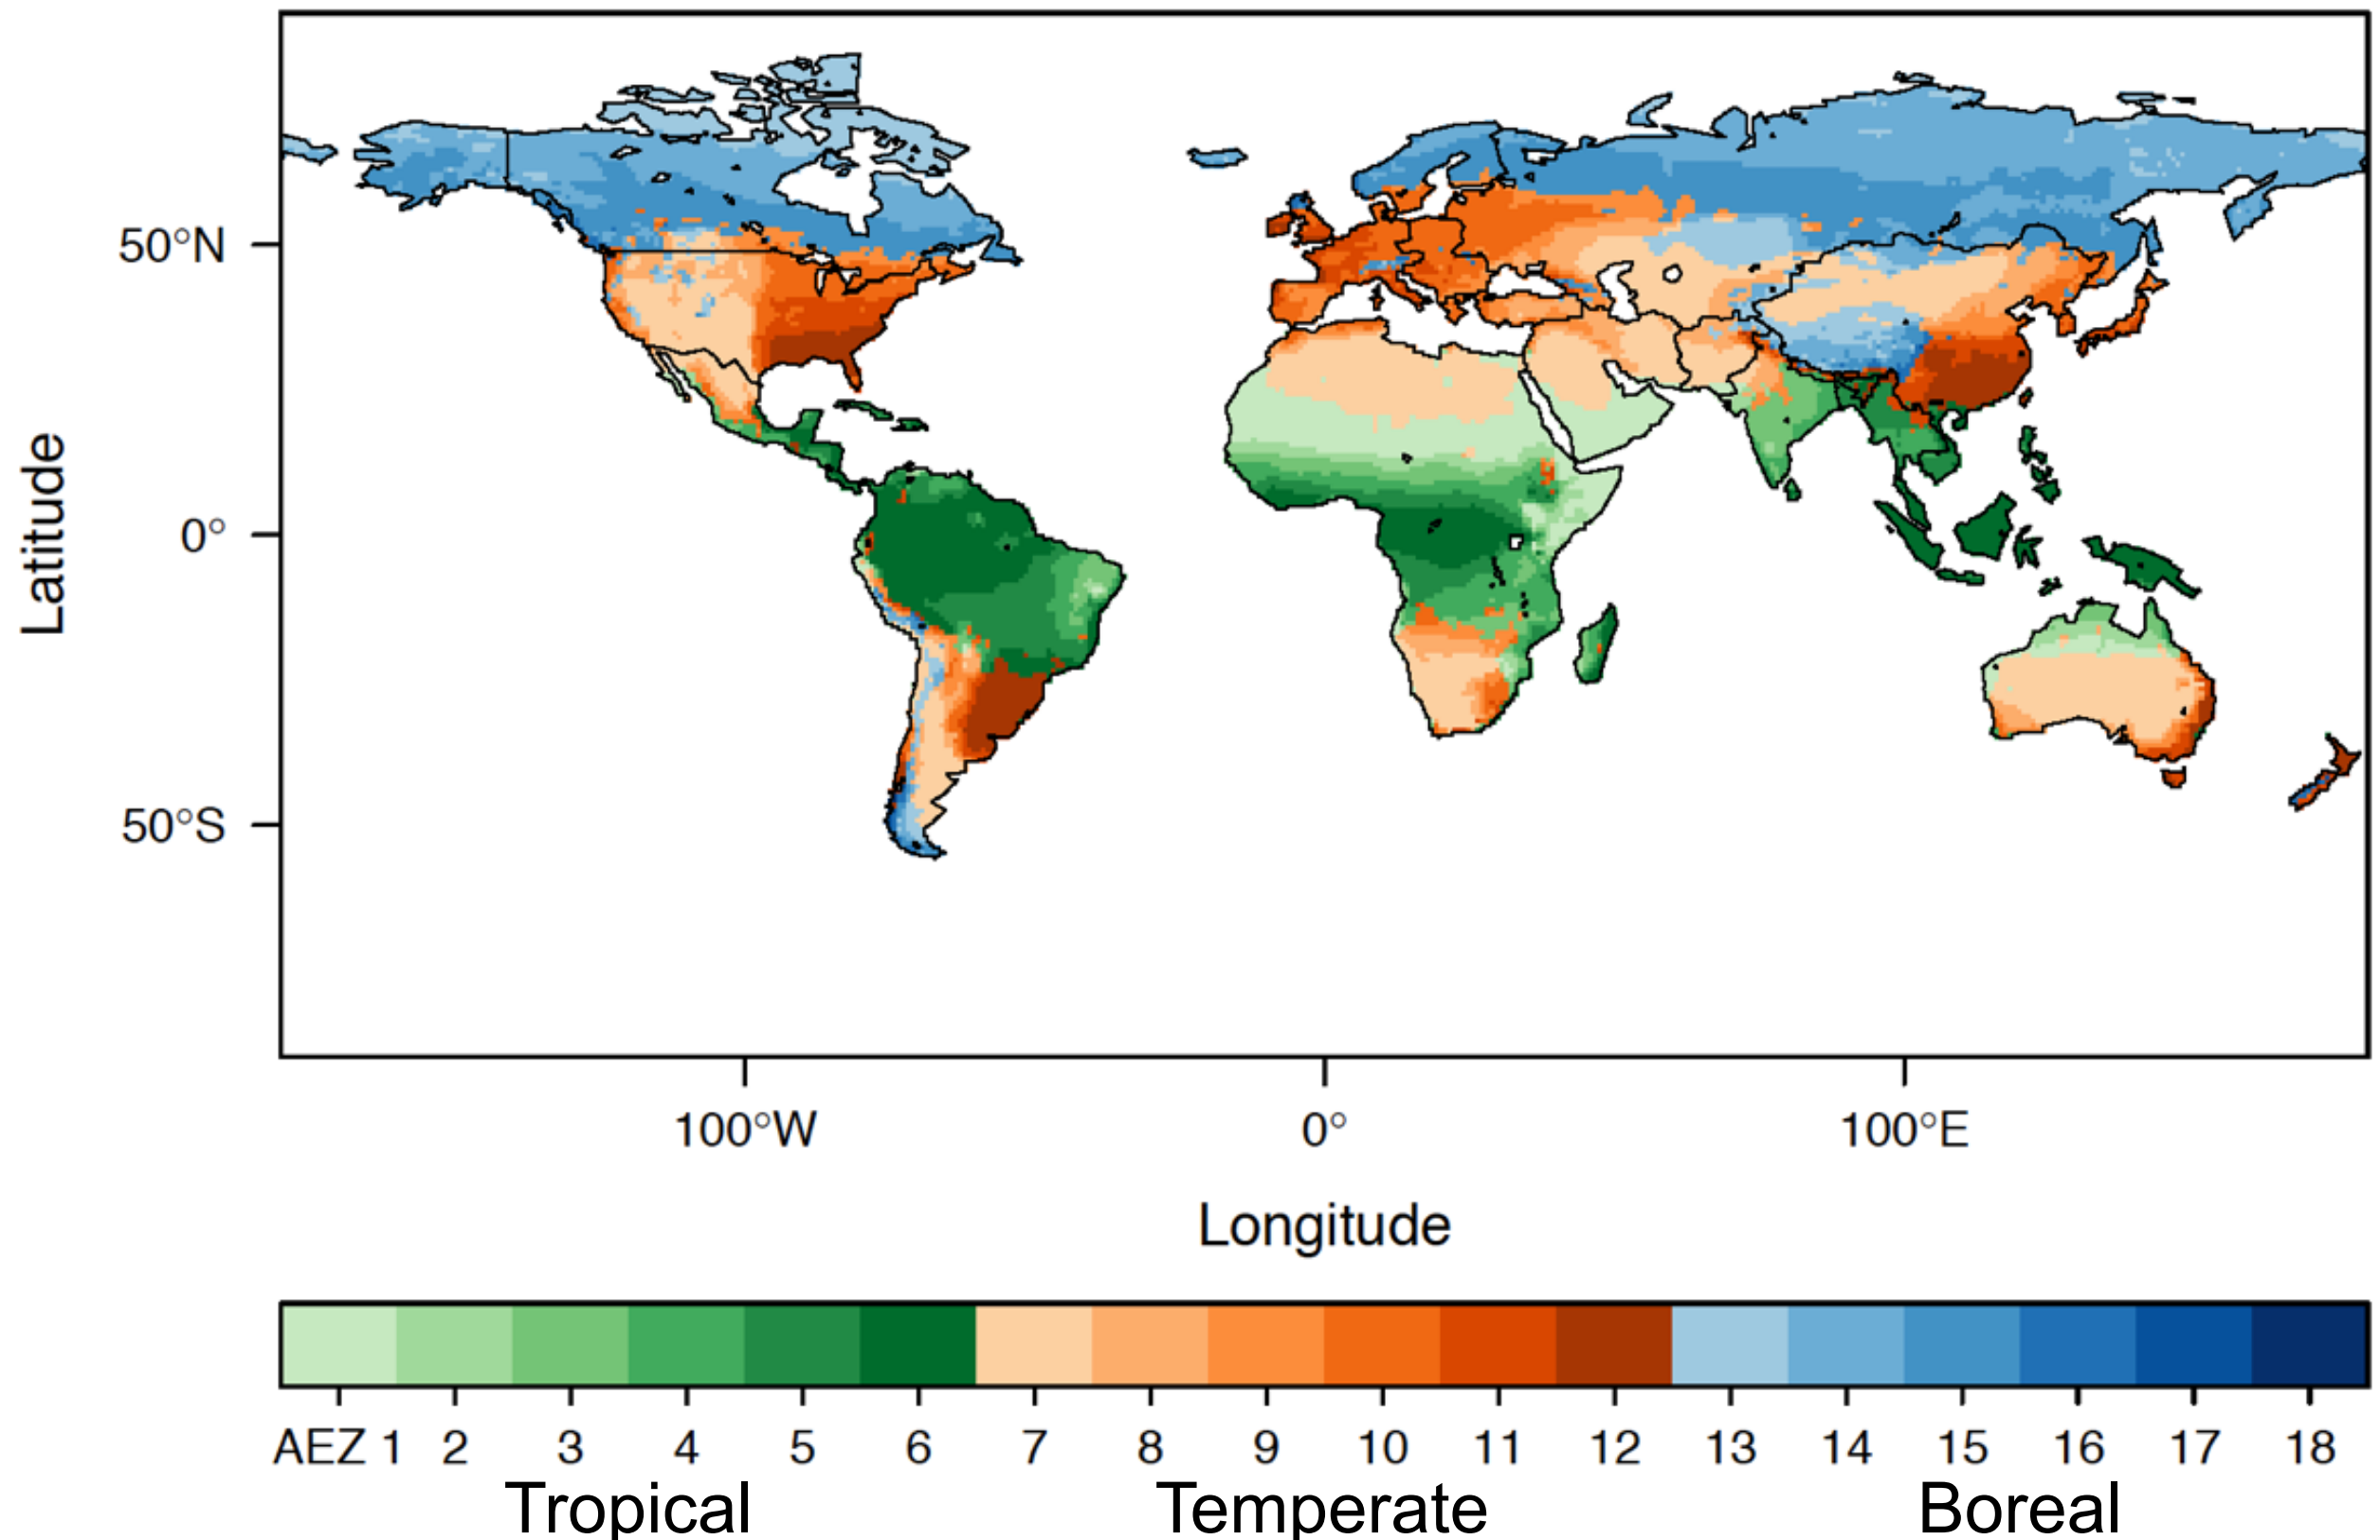

This work is supported by the Director, Office of Science, Office of Biological and Environmental Research of the U.S. Department of Energy under Contract No. DE-AC02-05CH11231 as part of their Integrated Assessment Research Program.

Different resolutions have different biases

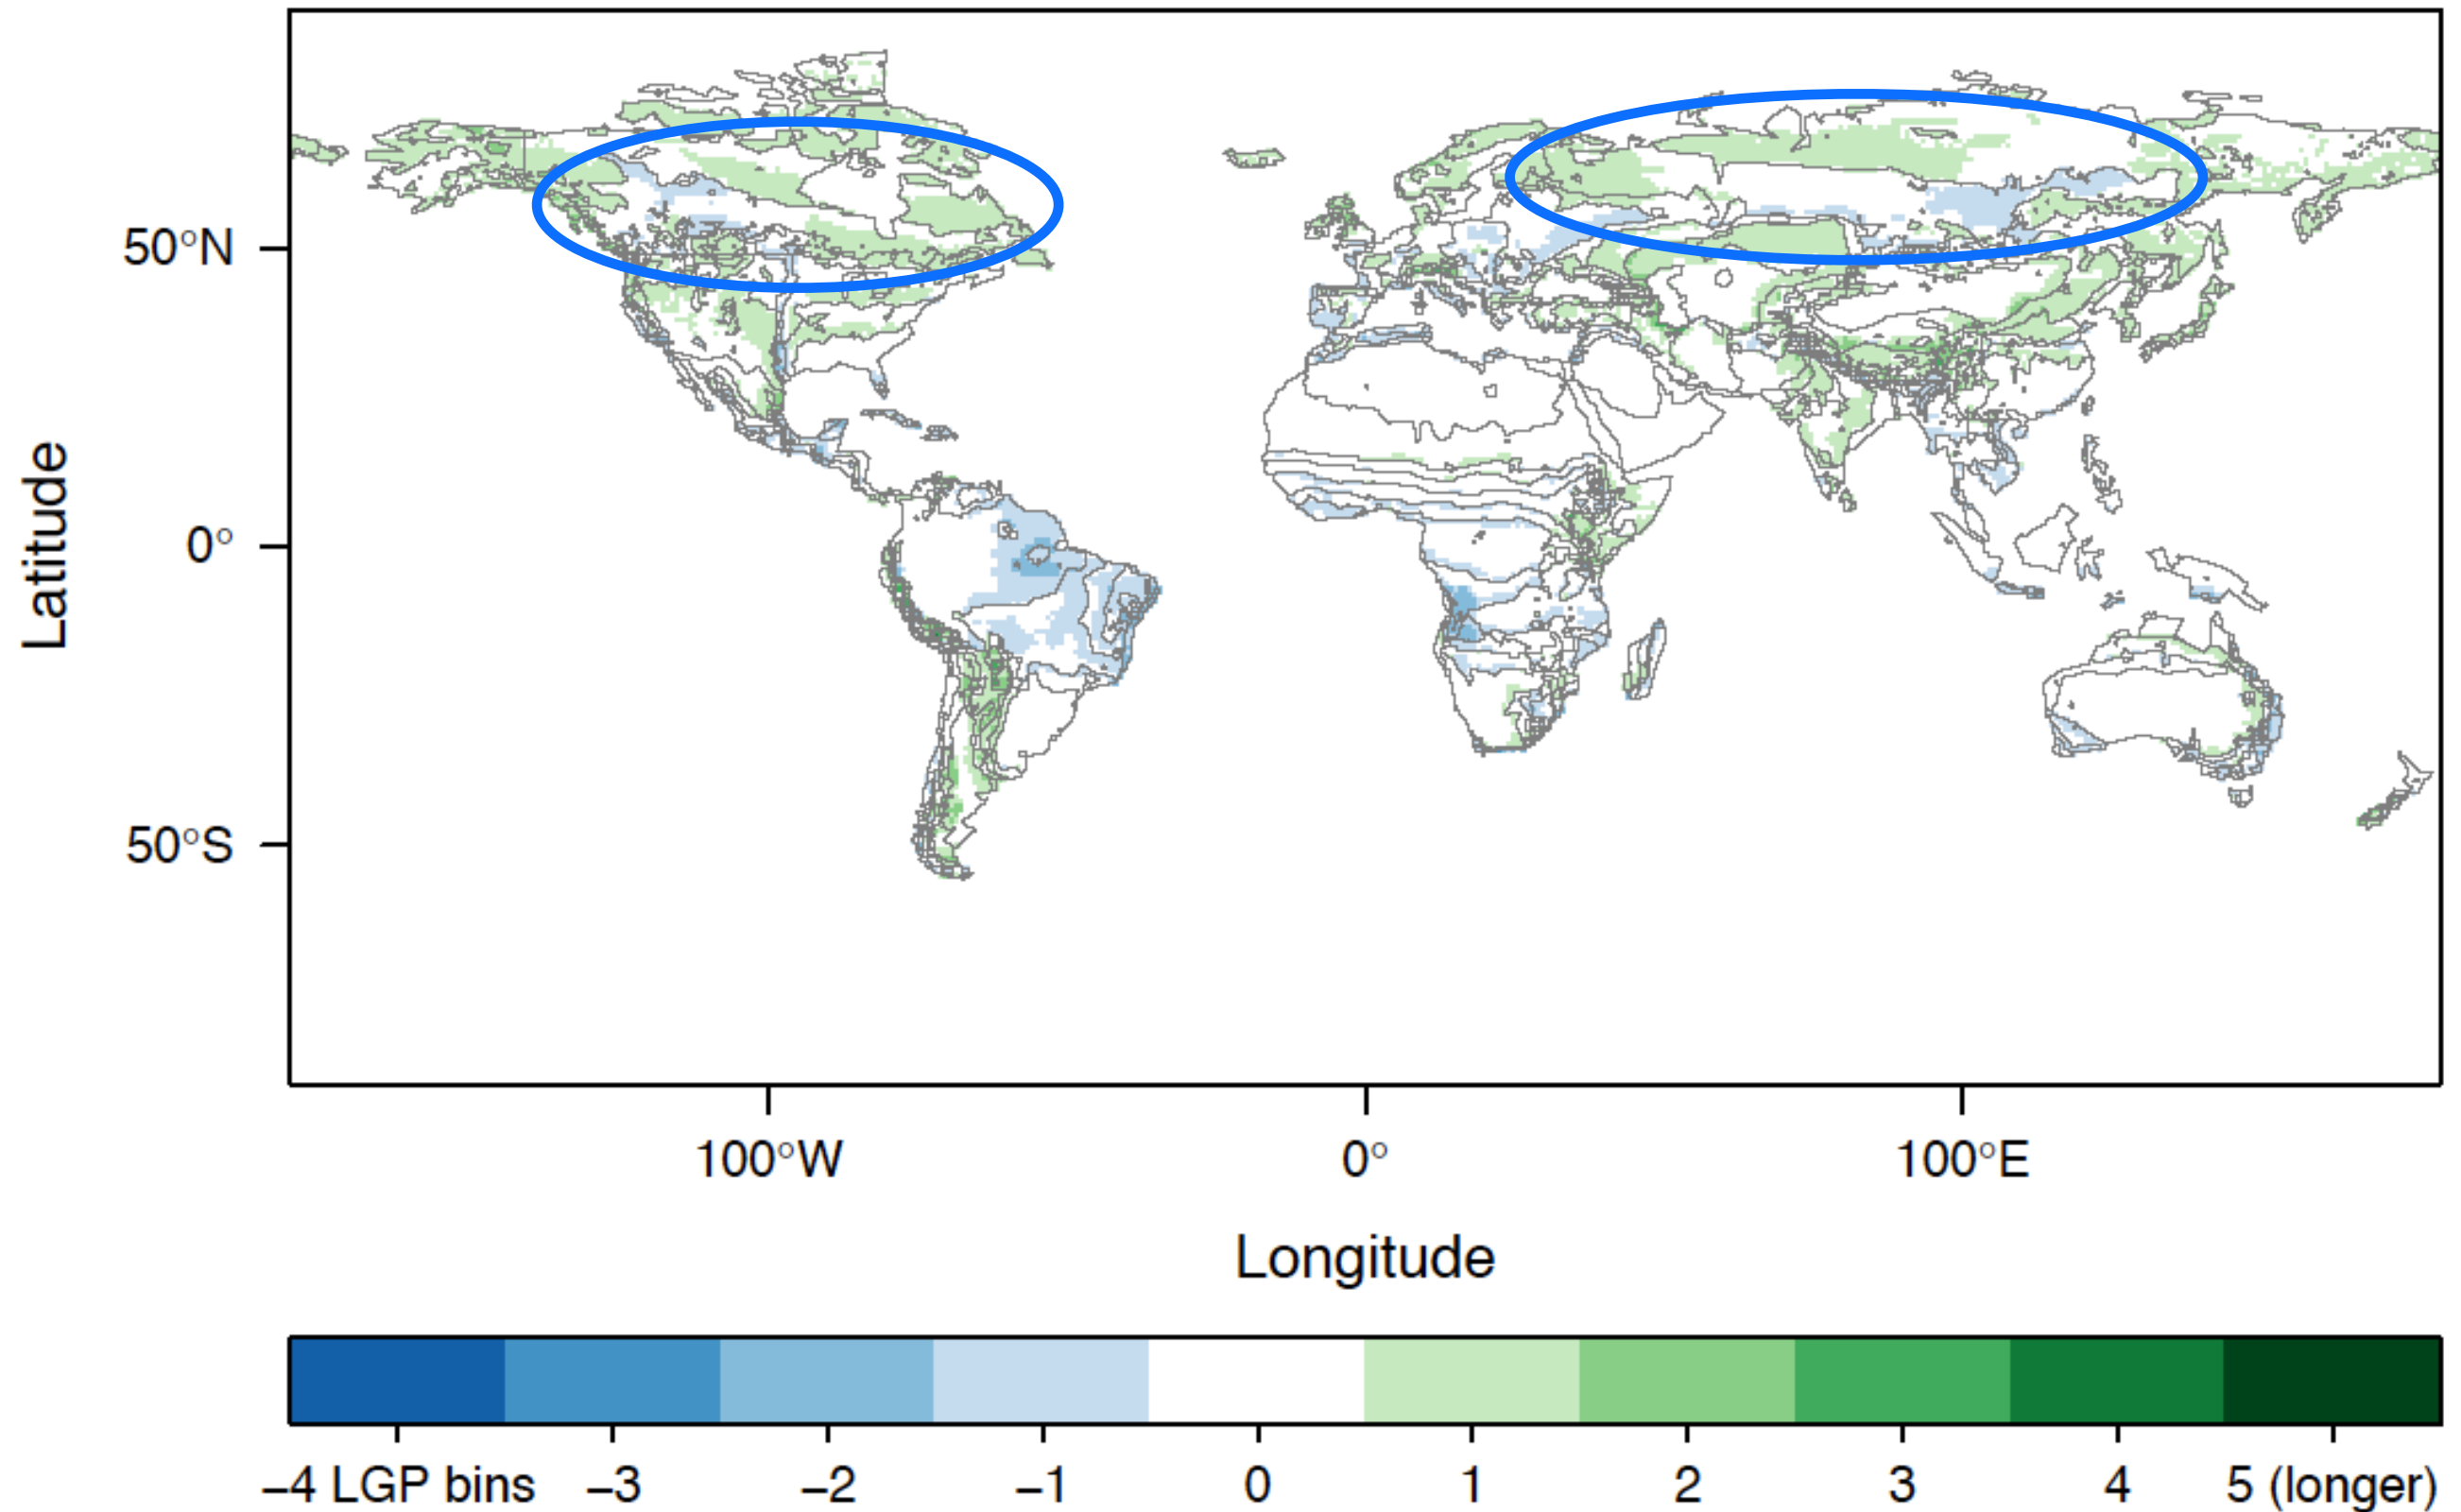

Land use distribution assumes uniform vegetation productivity within zones

Original baseline climate agro-ecological zones

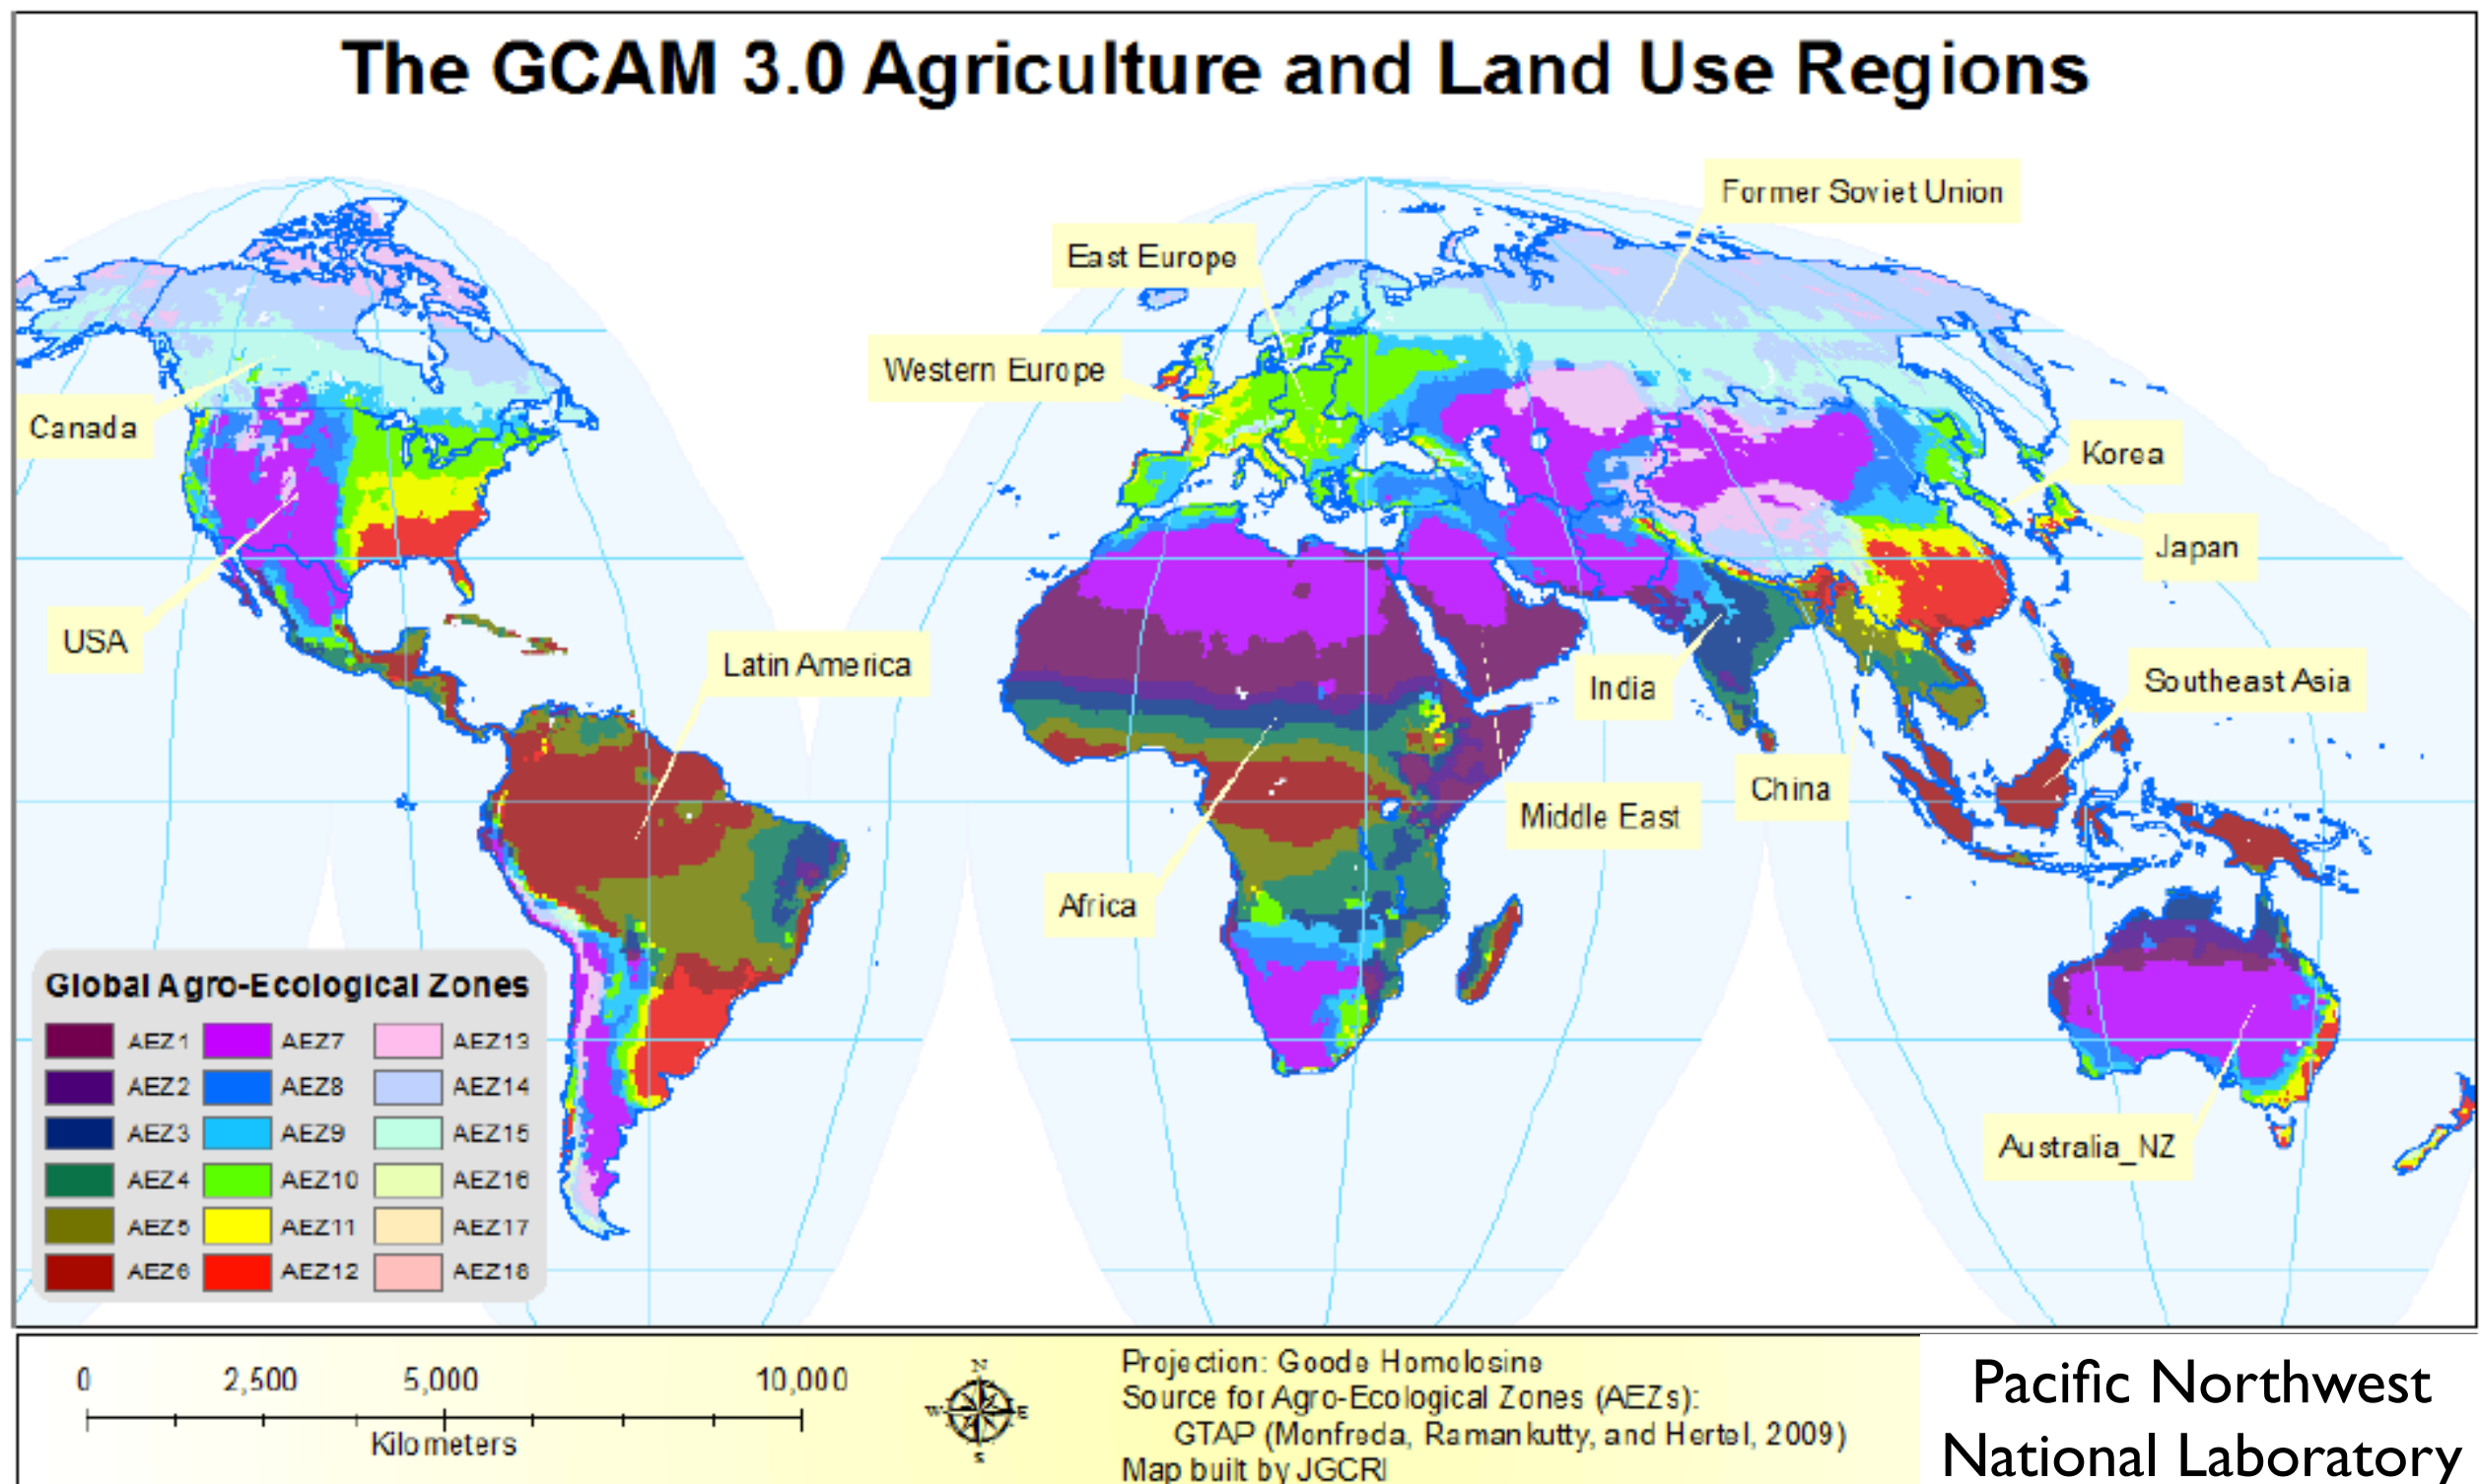

Current land units become heterogeneous

Length of growing period (LGP): ECHAM 2100 – original

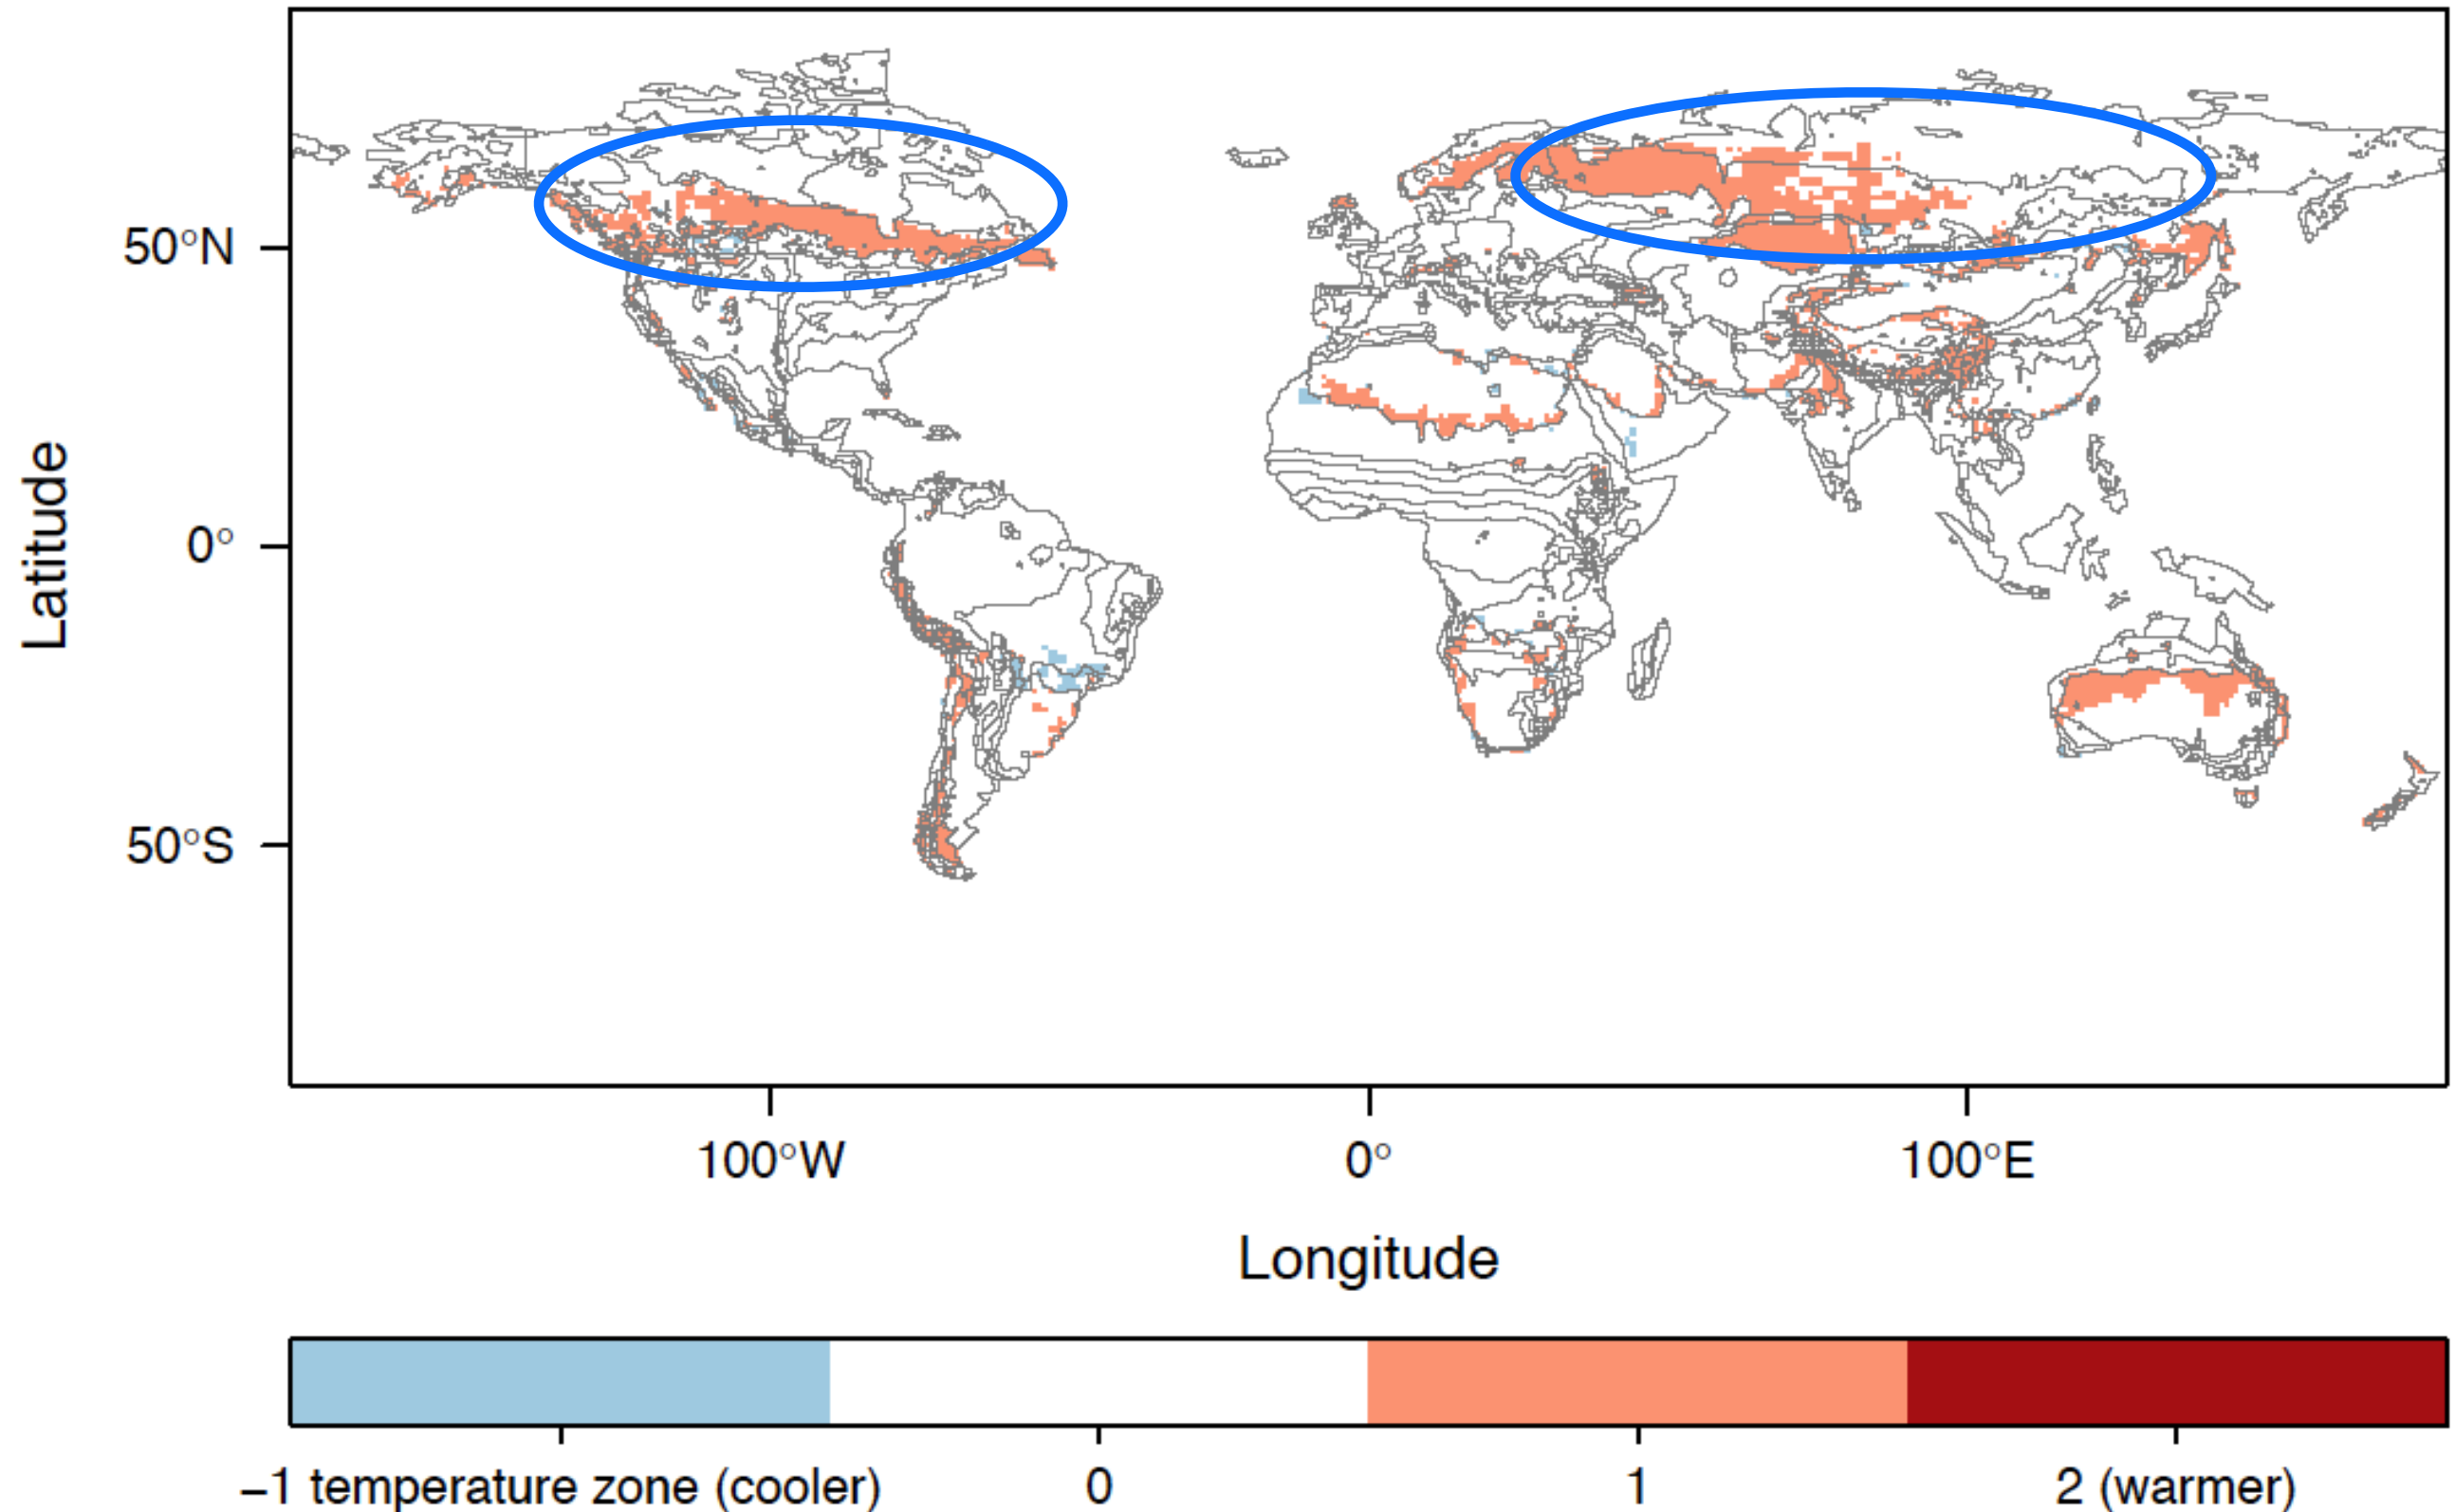

Land use distribution assumes uniform vegetation productivity within zones

- Do projected Agro-Ecological Zones alter land use trajectories?

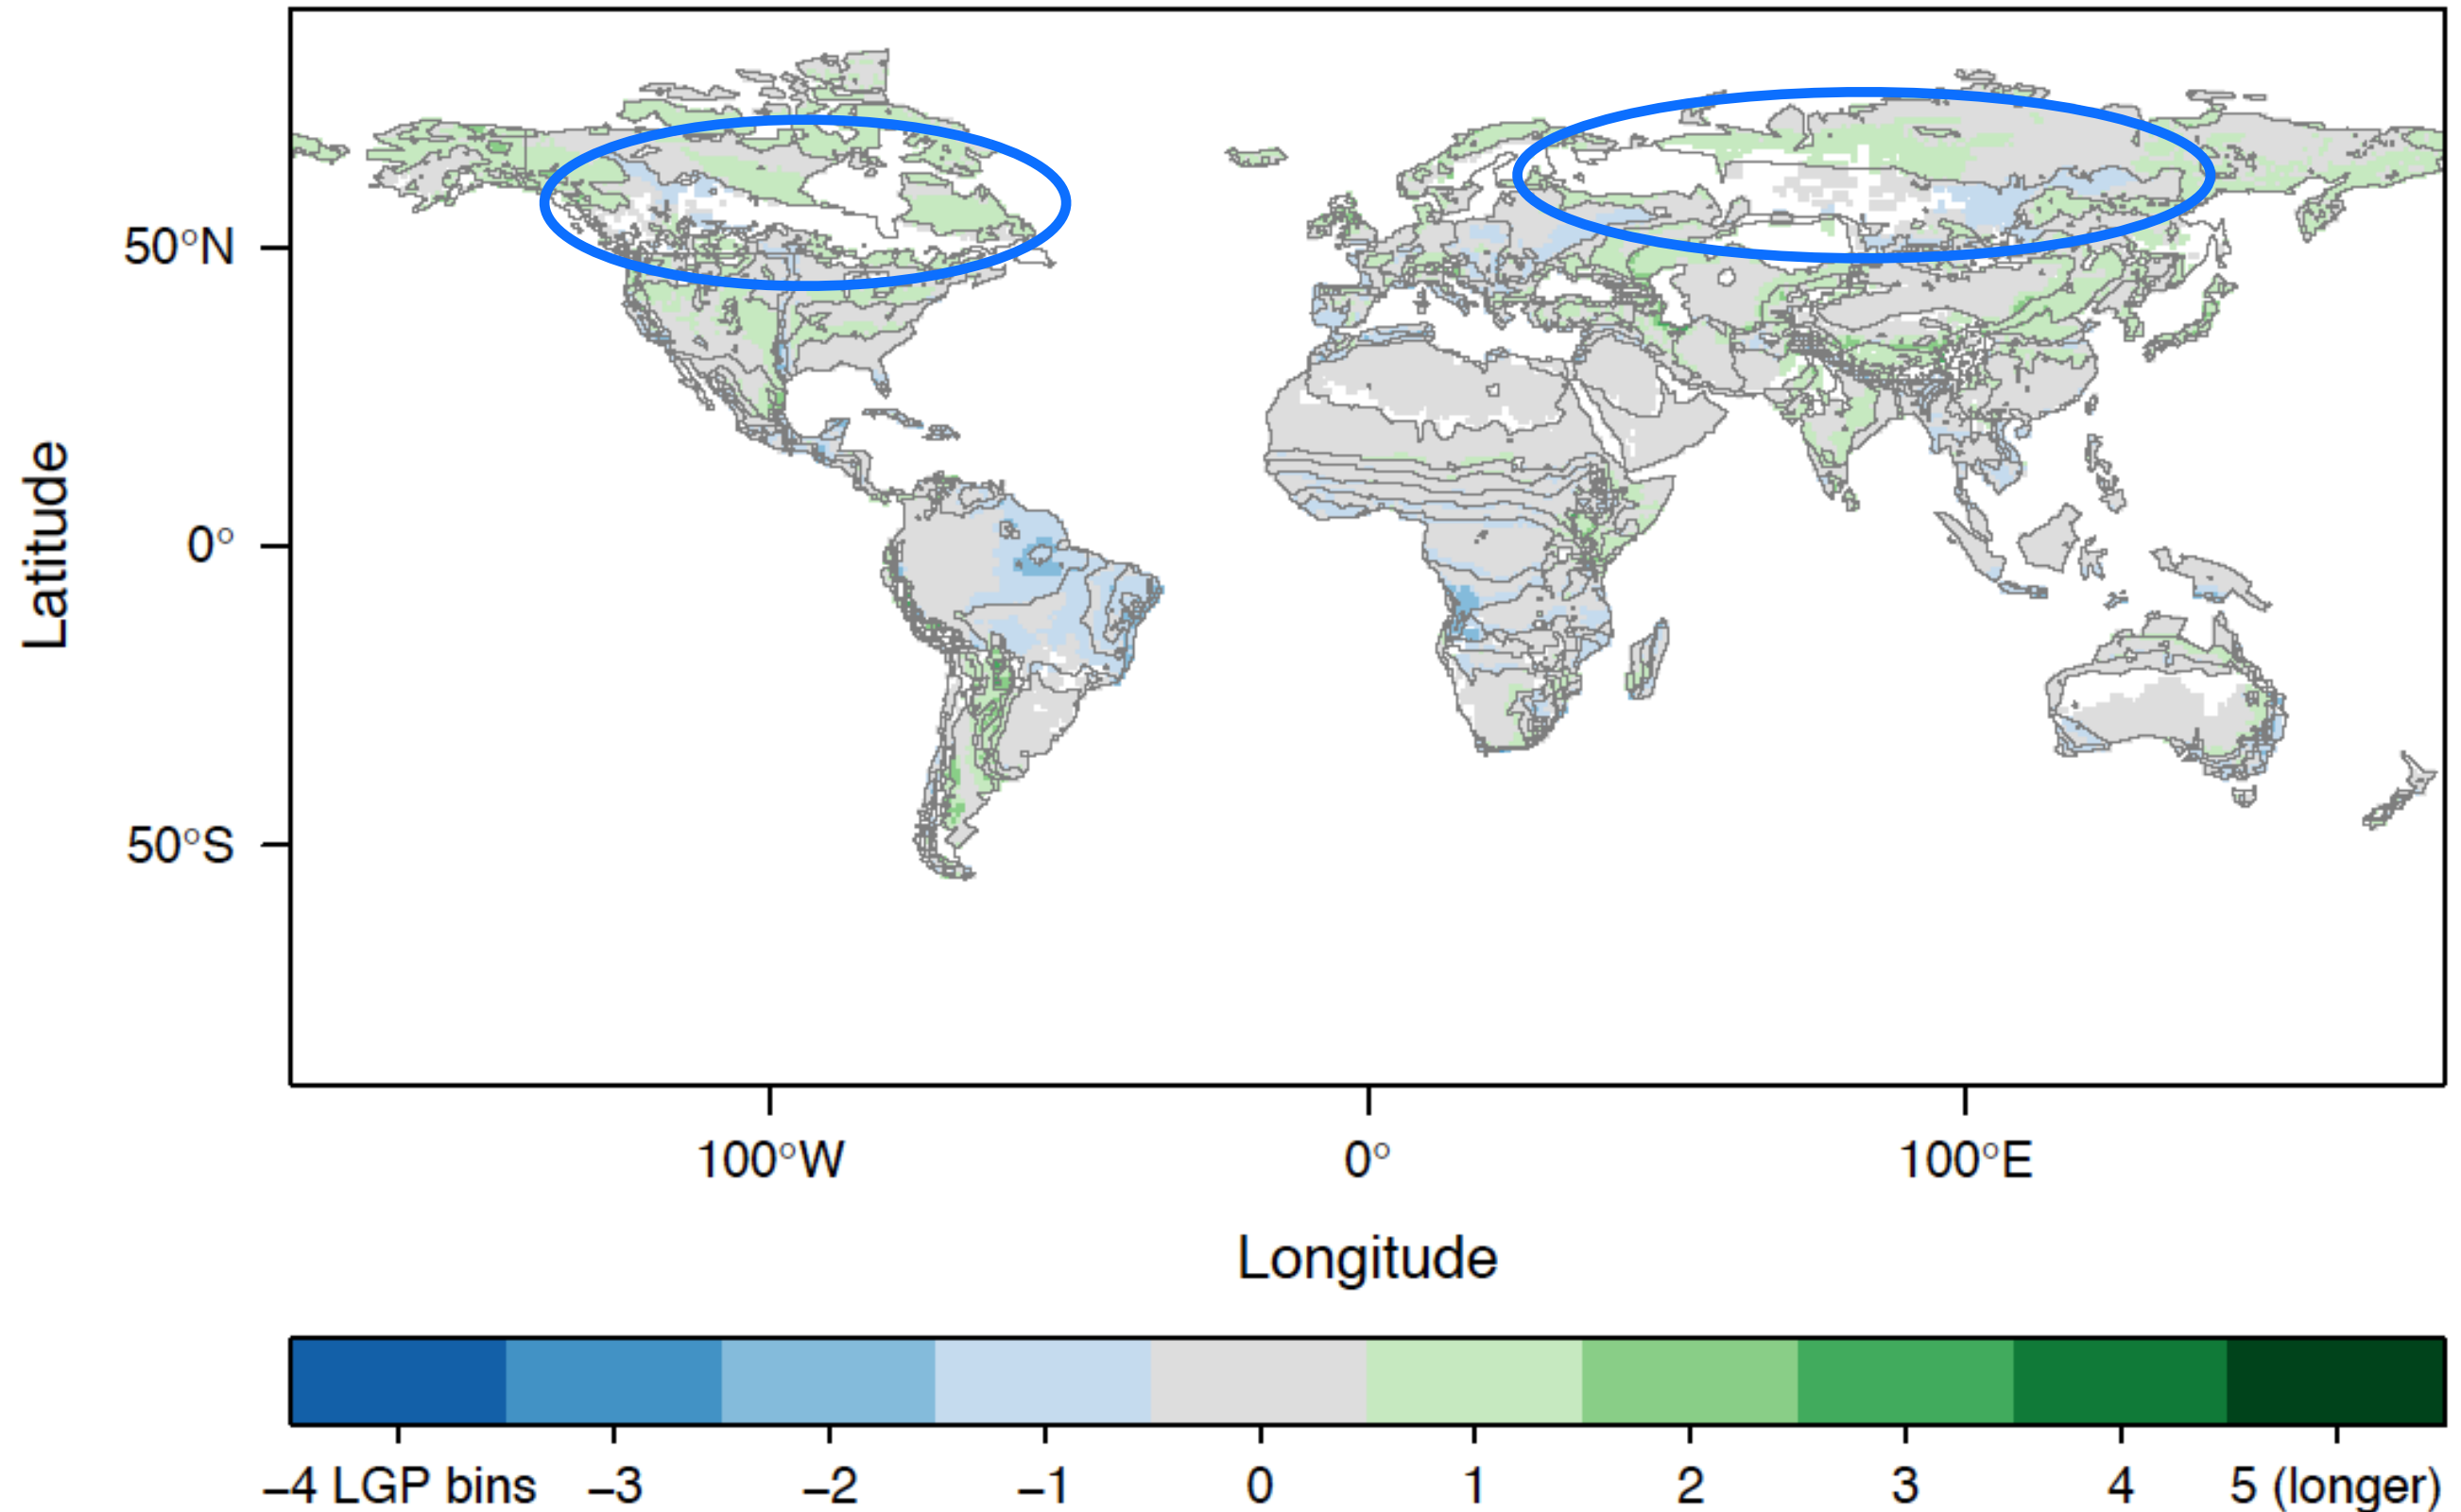

Current AEZs become heterogeneous

Temperature zone (TZ): ECHAM 2100 – original

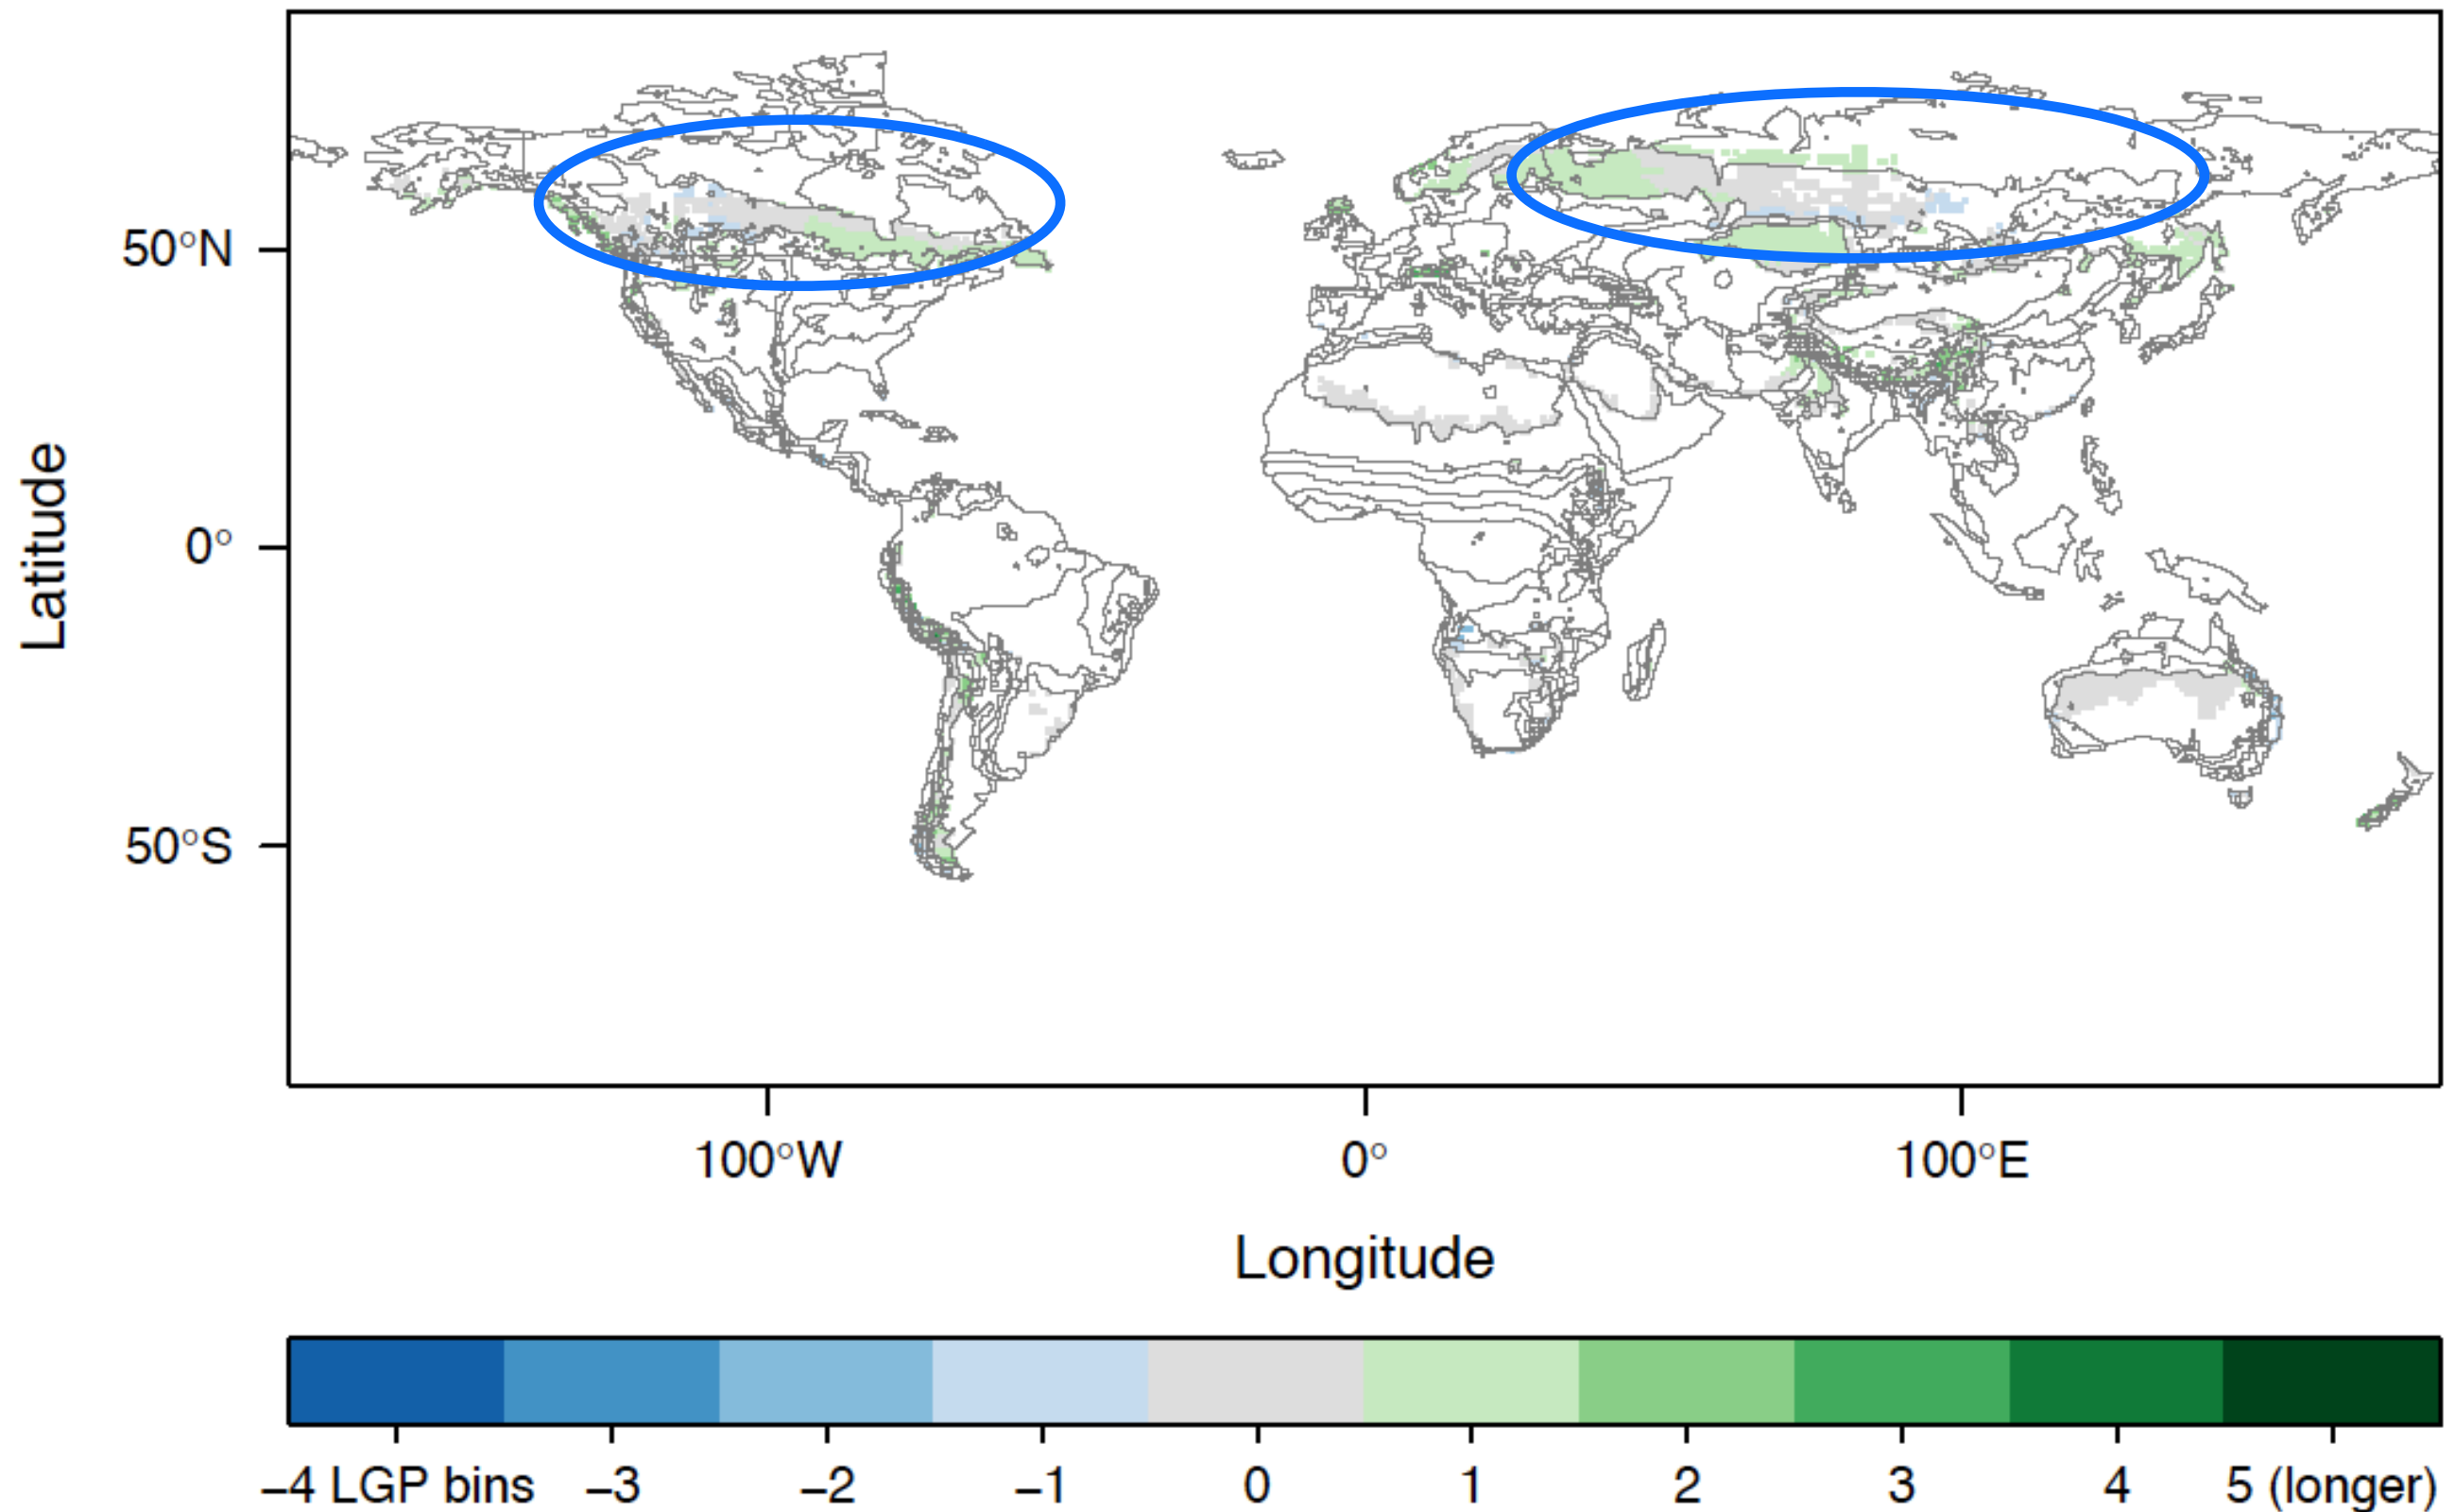

Current AEZs become heterogeneous

Length of growing period (for no TZ change): ECHAM 2100 – original

Current AEZs become heterogeneous

Length of growing period (for +1 TZ change): ECHAM 2100 – original

Global distributions of Maize, by country
