DOE Disposal Cells

Critical Infrastructure for
Nuclear Waste Management

- 28 engineered disposal cells across the US
- Regular inspection and monitoring required

Safely containing hazardous and radioactive waste in DOE disposal cells is crucial to environmental protection, public health, and trust.

U.S. DEPARTMENT OF ENERGY
Legacy Management

Engineered Layered Repositories

DOE Long-Term Surveillance Plan

- Designed to contain millions of cubic yards of radioactive material
- Expected stability: 200 – 1,000 years
- Routine maintenance
- Emergency measures protocols

Field records are vital to managing and maintaining cell structural integrity and regulatory compliance

Current Challenges

Emerging Issues in Long-Term Surveillance

- Premature subsurface erosion discovered
- Climate change impacts on cell stability

Mexican Hat Disposal Cell, 2017

FIU

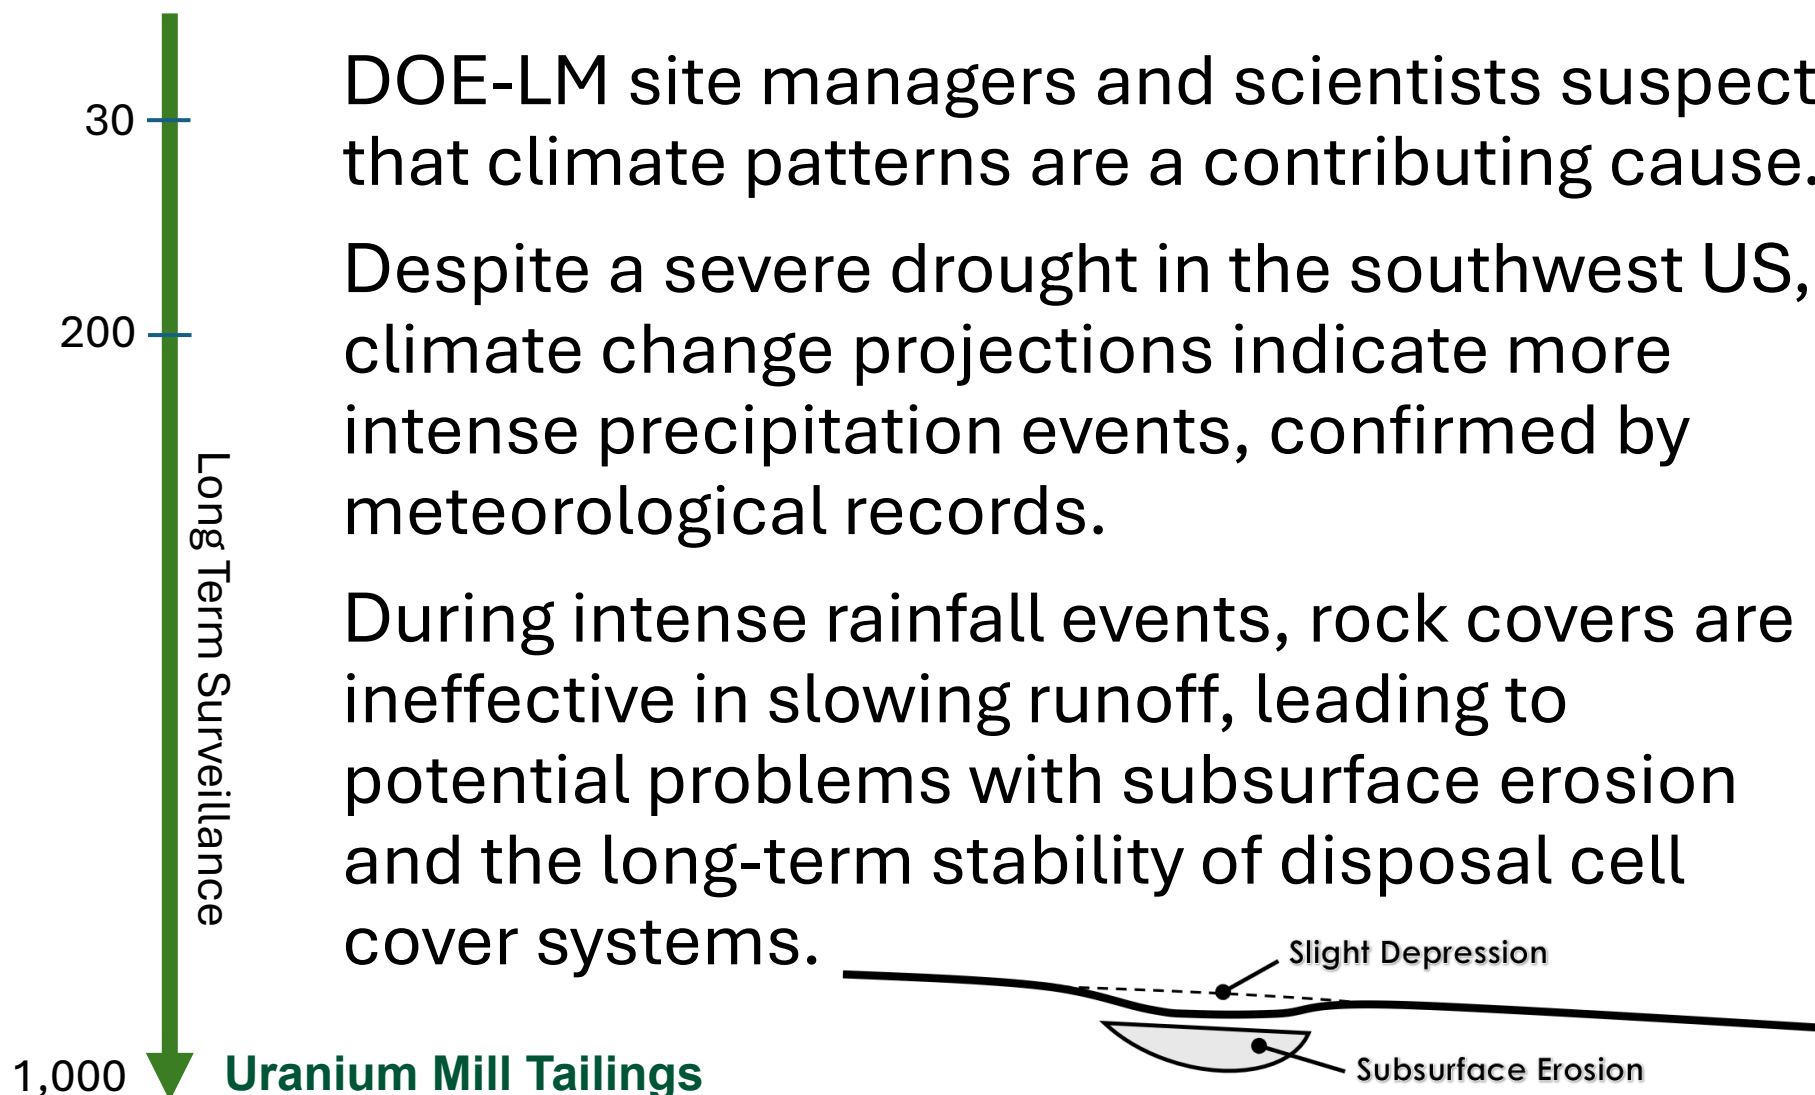

Premature Subsurface Erosion

DOE-LM site managers and scientists suspect that climate patterns are a contributing cause.

Despite a severe drought in the southwest US, climate change projections indicate more intense precipitation events, confirmed by meteorological records.

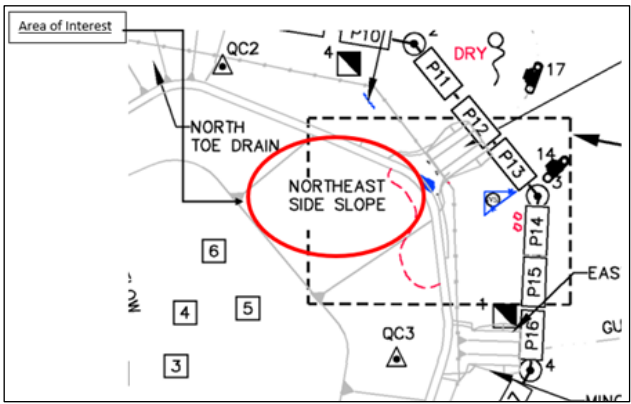

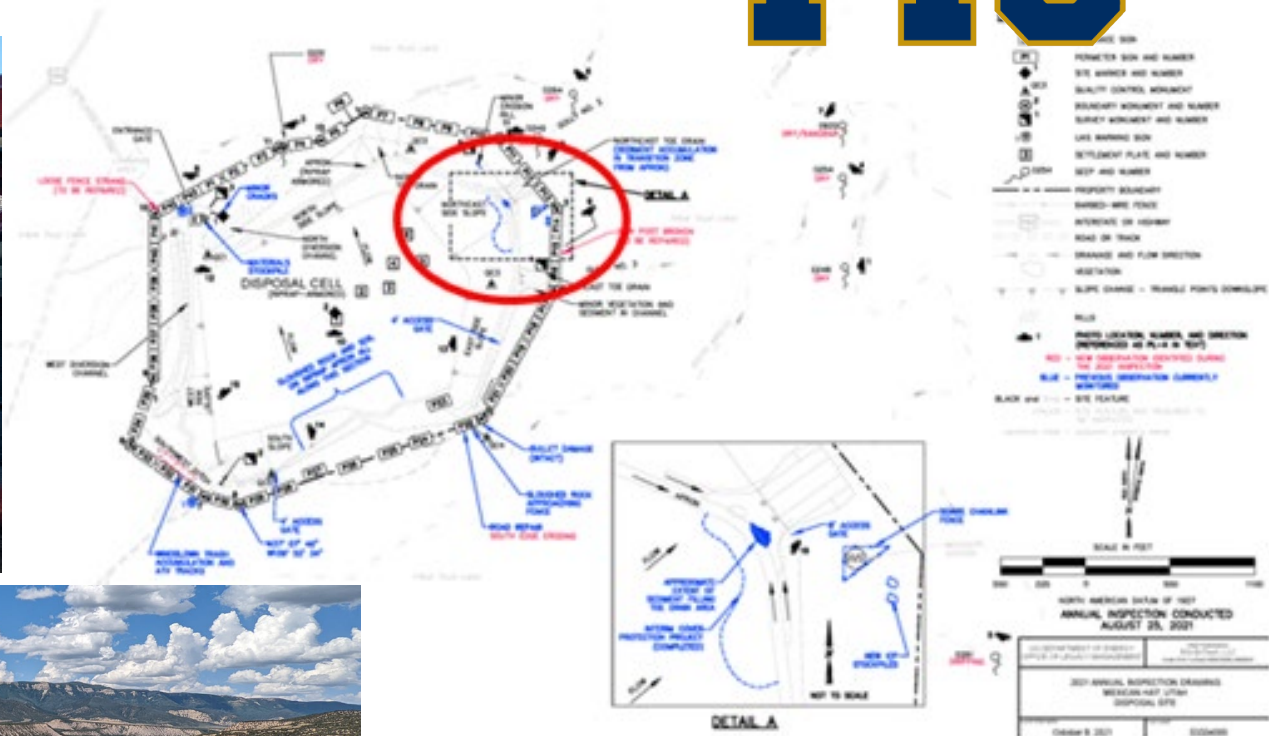

During intense rainfall events, rock covers are ineffective in slowing runoff, leading to potential problems with subsurface erosion and the long-term stability of disposal cell cover systems.

Long-Term Surveillance Plans

FIU

DOE annual site inspections

Noninvasive Evaluation Framework

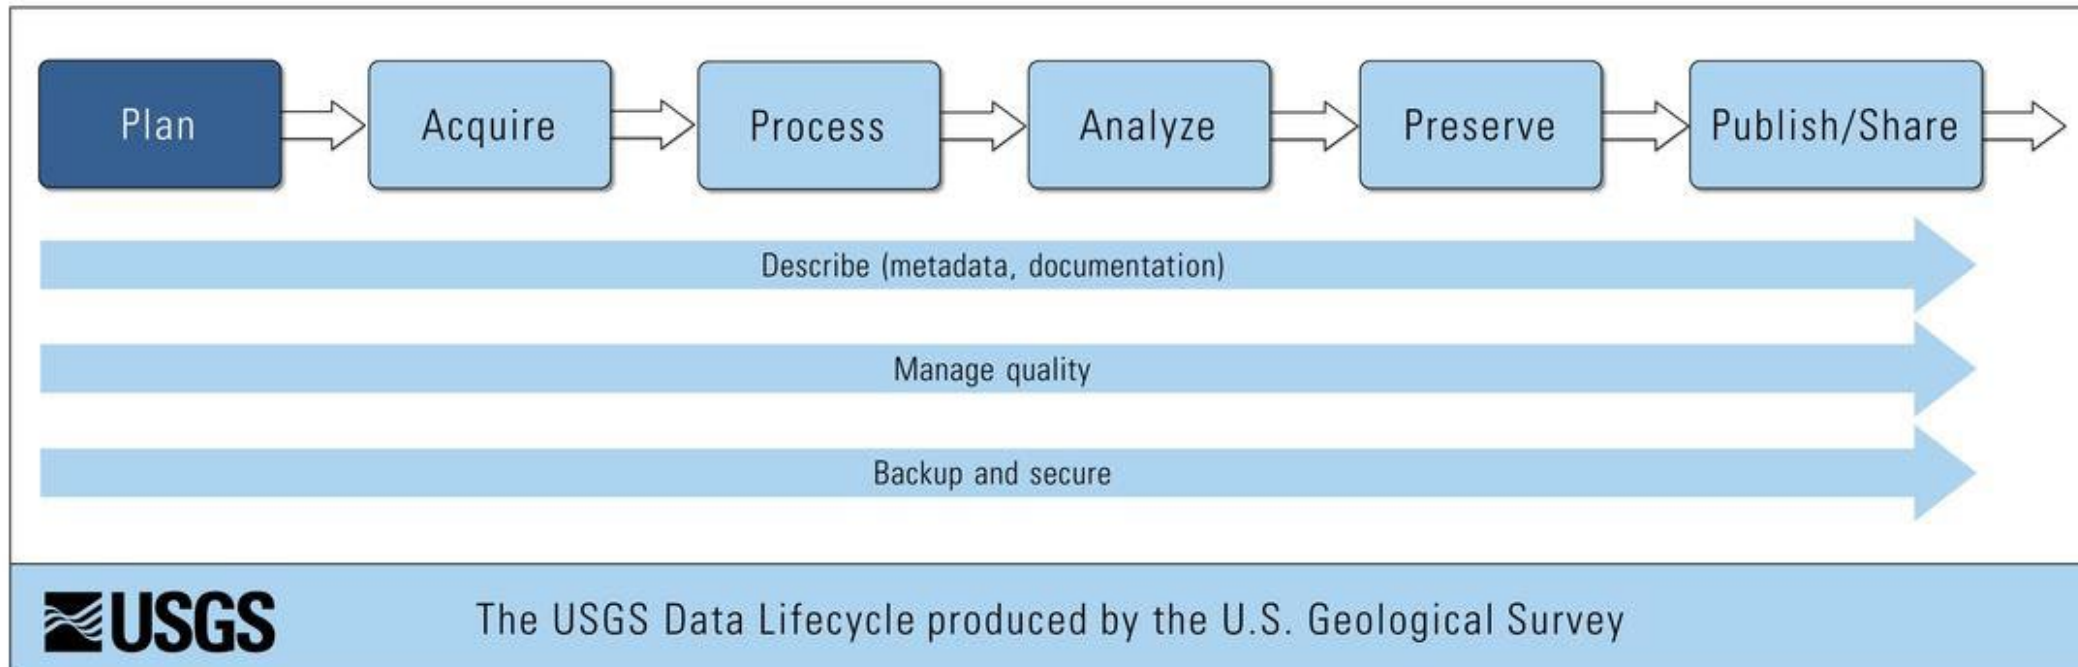

"Assess potential erosion features using minimally invasive inspection methods to avoid disturbing additional material, as erosion of the radon barrier could create potential radiological exposure risks."

Onsite Autonomous Surveys

- Centimeter-level precision
- Cost-effective
- Meaningful data at your disposal
- Broad custom-built sensory
- See beneath the surface
- Automated data collection
- Machine Learning historical change
- Data-driven decision-making

Methodology

- 2022 —
- ## Phase I: Robot Development
- GPR robot design and prototype construction
 - Remote-controlled testing in lab environments for core functionality
 - The prototype is deployed in the disposal cell and other DOE sites
 - Evaluate the performance of the hardware
 - The accuracy of the GPR data
 - Provide preliminary subsurface conditions to the DOE for consideration of technology.

- 2024 —
- ## Phase II: Automation
- Upgraded prototype with enhanced perception and navigation
 - Autonomous navigation and sensor integration tests in field settings

- 2025 —
- Redeploy at DOE sites

Phase III: Full Autonomy

- Fully autonomous GPR surveys and data processing
- Goal: complete site coverage with minimal human intervention
 - Deploy a final system at DOE sites and demonstrate technology potential
 - Finally, transfer technology to DOE

2026

Ground Platform

Platform Frame

- Dimensions: 66" x 44" x 32"
- Weight: 250 pounds
- Custom aluminum extrusion chassis
- Saddle-shaped design for GPR housing
- Modular construction without welds

Drive System

- 4 All wheel drive
- 4 x 250W gear DC motors (24V)
- 13" heavy-duty pneumatic tires
- 318 lb-in torque per wheel
- 31° parallel steering mechanism
- 67" turning radius
- 2.90 mph maximum speed

Transport

The chassis shape considers the SUV's cargo volume for deployment.

Drive System

Solar-Powered Sustainability

Power Sources

- Dual 100W monocrystalline solar panels
- Two 24V 25Ah LiFePO4 batteries
- MPPT charge controller

Safety Features

- Built-in battery protection
- Voltage spike management
- Thermal regulation
- Emergency power cutoff

Subsurface Imaging

Conclusion

Automating inspections of DOE disposal cells poses significant challenges due to the vast areas and complex operational demands, making traditional grid surveys impractical.

A fully autonomous, multi-sensor robot capable of conducting comprehensive coverage surveys while employing energy-efficient navigation strategies represents a transformative solution.

Guided by active mapping, this system integrates terrain, radiation, and subsurface data with environmental sensors to detect and monitor critical trends, making it an invaluable tool for effective landfill management and long-term site monitoring.
