

Message Bus Refactor Using RabbitMQ

September 25, 2019

Shwetha Niddodi
Software Engineer

Agenda

- Need for message bus upgrade
- Difference between ZeroMQ VOLTTRON and RabbitMQ VOLTTRON
- RabbitMQ VOLTTRON overview
- Connecting to remote platform using CSR
- Deployment use case example
- Integration with third party tools

Message Bus Upgrade

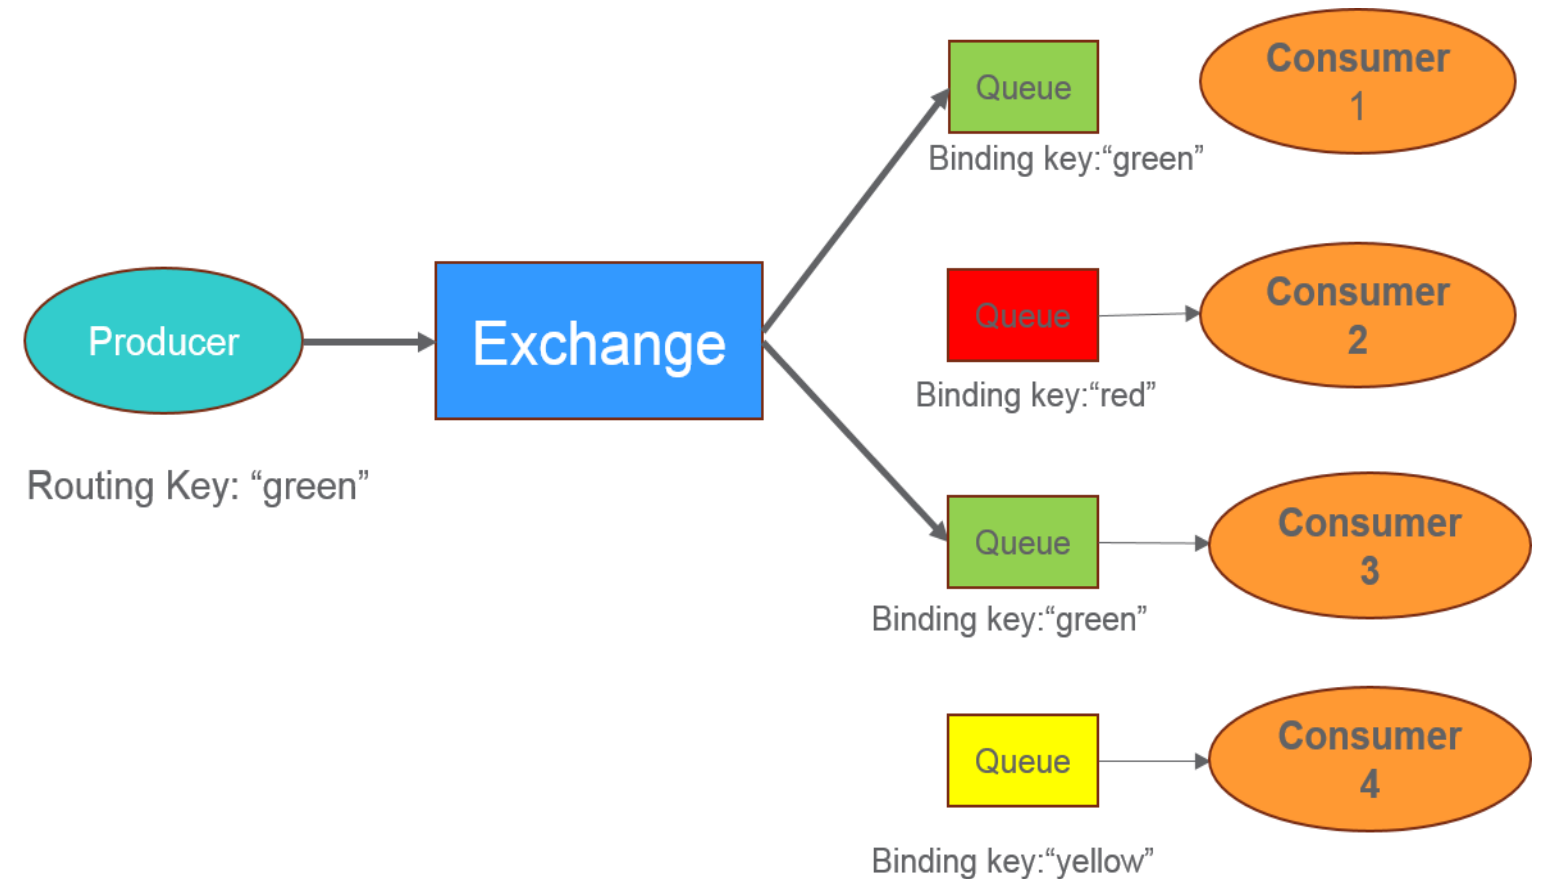

- VOLTTRON's ZeroMQ based message bus has been key for meeting the security and interoperability goals of the platform
- At the same time, RabbitMQ has become more mature as it has seen major investment by commercial companies.
 - Rabbit Technologies, now part of Pivotal Technologies (VMWARE spin-out). \$105 million investment by GE in 2013.
 - Used by: Instagram, Indeed.com, Google Cloud Platform, Tesla ...
- Goals of the Refactor:
 - Maintain essential features of current message bus and minimize transition cost
 - Leverage an existing and growing community dedicated to the further development of RabbitMQ
 - Move services provided currently by VOLTTRON agents to services natively provided by RabbitMQ
 - Decrease VOLTTRON development time spent on supporting message bus which is now a commodity technology.
 - Address concerns from community about ZeroMQ
- View this effort as essential to the long-term future of the platform
 - Working with heavy users in the community to get feedback
 - Reduce long term costs of platform by moving message bus development out of core
 - Maintain support for ZMQ short term (3 – 5 years) as funding allows

ZeroMQ Based VOLTTRON vs RabbitMQ Based VOLTTRON

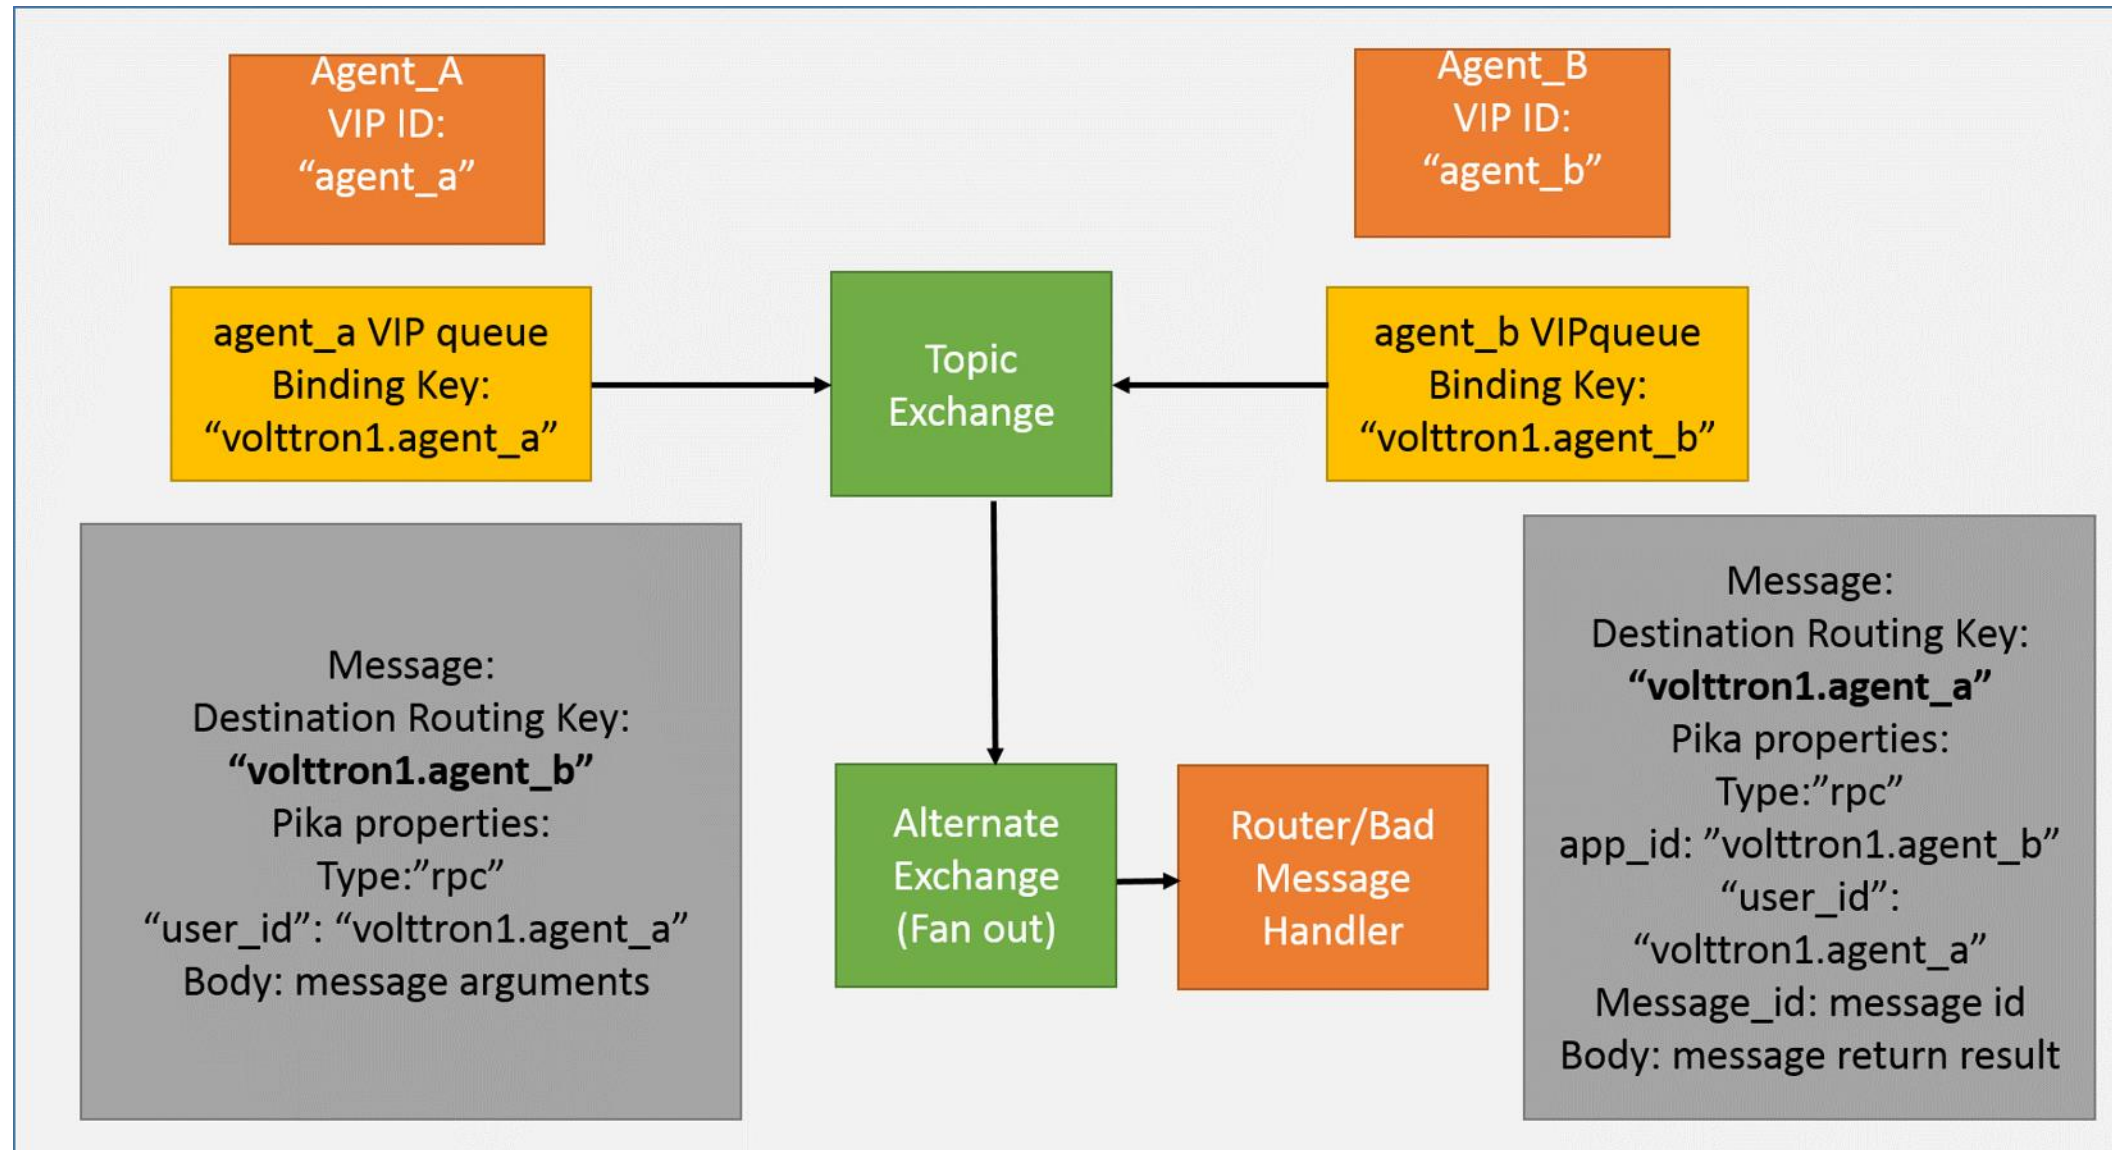

| ZeroMQ Based VOLTTRON | RabbitMQ Based VOLTTRON |
|----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Platform acts as the broker and is responsible for routing the messages | Separate broker running outside the platform and all agents connect to that broker. Exchanges are responsible for routing. |
| Authentication is based on ZAP protocol using Elliptical Cryptographic Curve Key | SSL based authentication using TLS X509 certificates |
| Remote agent authentication is by adding public key of remote agent to auth.json | Remote agent authentication is through Certificate Signing Request operation |
| Custom agents such as forward historian agent for forwarding messages from one platform to another | Shovel plugin can be used for same purpose |
| VOLTTRON specific implementation for multi-platform connection | Federation plugin can be used for same purpose |
| Custom agents to connect to third party tools such as MQTT historian agents | Easy integration with third party tools <ul style="list-style-type: none"> - MQTT - ElasticSearch |
| Need to build custom agent that monitors status of message bus | Monitor message bus status such as message rates, resource usage of queue and data rates of client connections |
| Scalable multi-platform connections | Highly scalable – does not require $O(n^2)$ connections between n brokers |
| Less flexibility in deployment compared to RabbitMQ | Flexibility in deployment |

RabbitMQ Overview

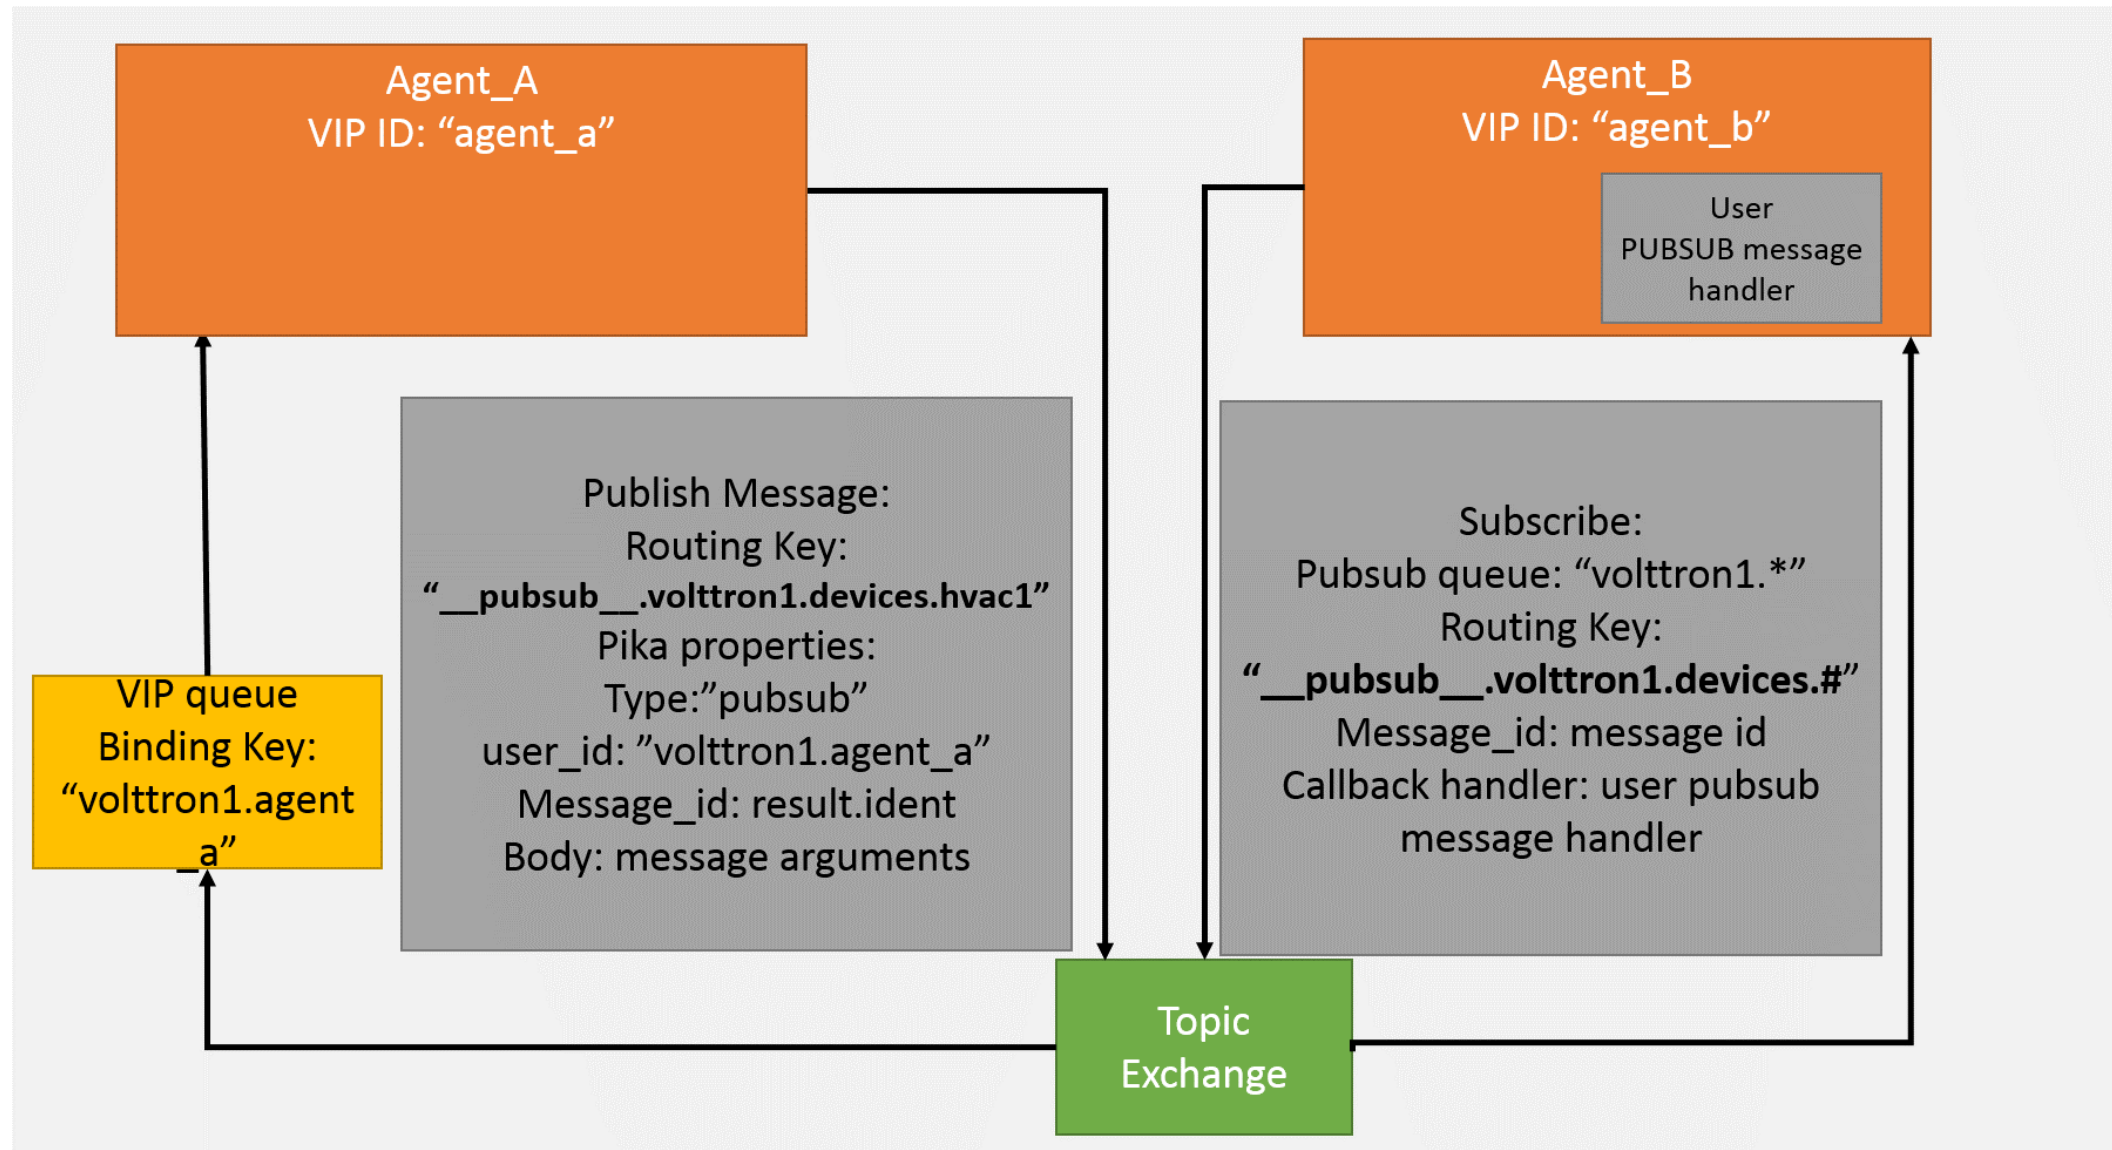

- RabbitMQ uses RabbitMQ uses AMQP (Advanced Message Queuing Protocol)
- Exchanges – Responsible for routing of messages to Queues.
- Queues - Buffer that stores the messages until consumed by consumer.
- Bindings – Queues bind to the exchange with binding keys
 - Messages are routed based on bindings

Integration Of RabbitMQ With VOLTRON

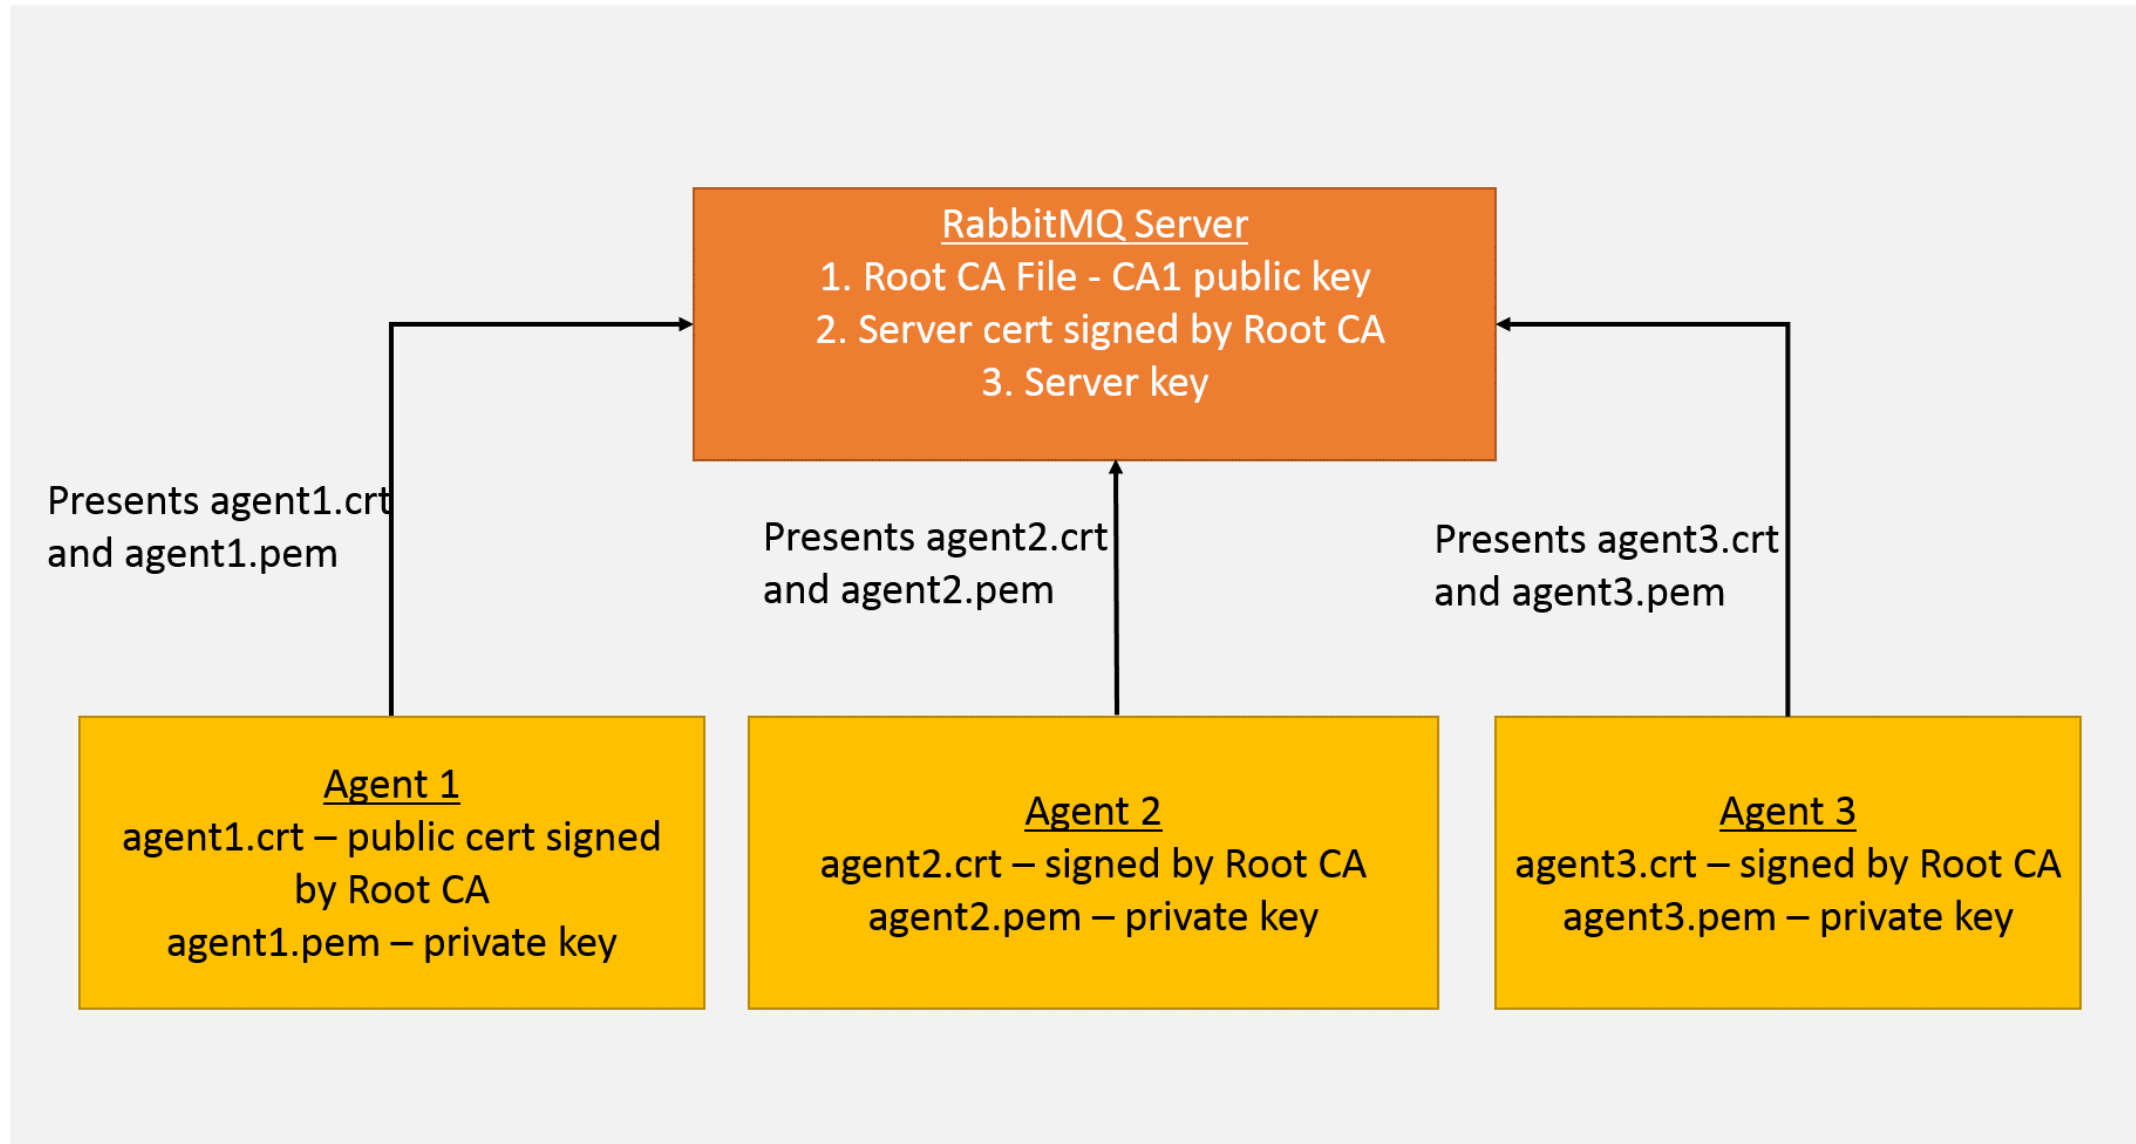

Pubsub in RabbitMQ VOLTRON

Security Feature With RabbitMQ VOLTRON

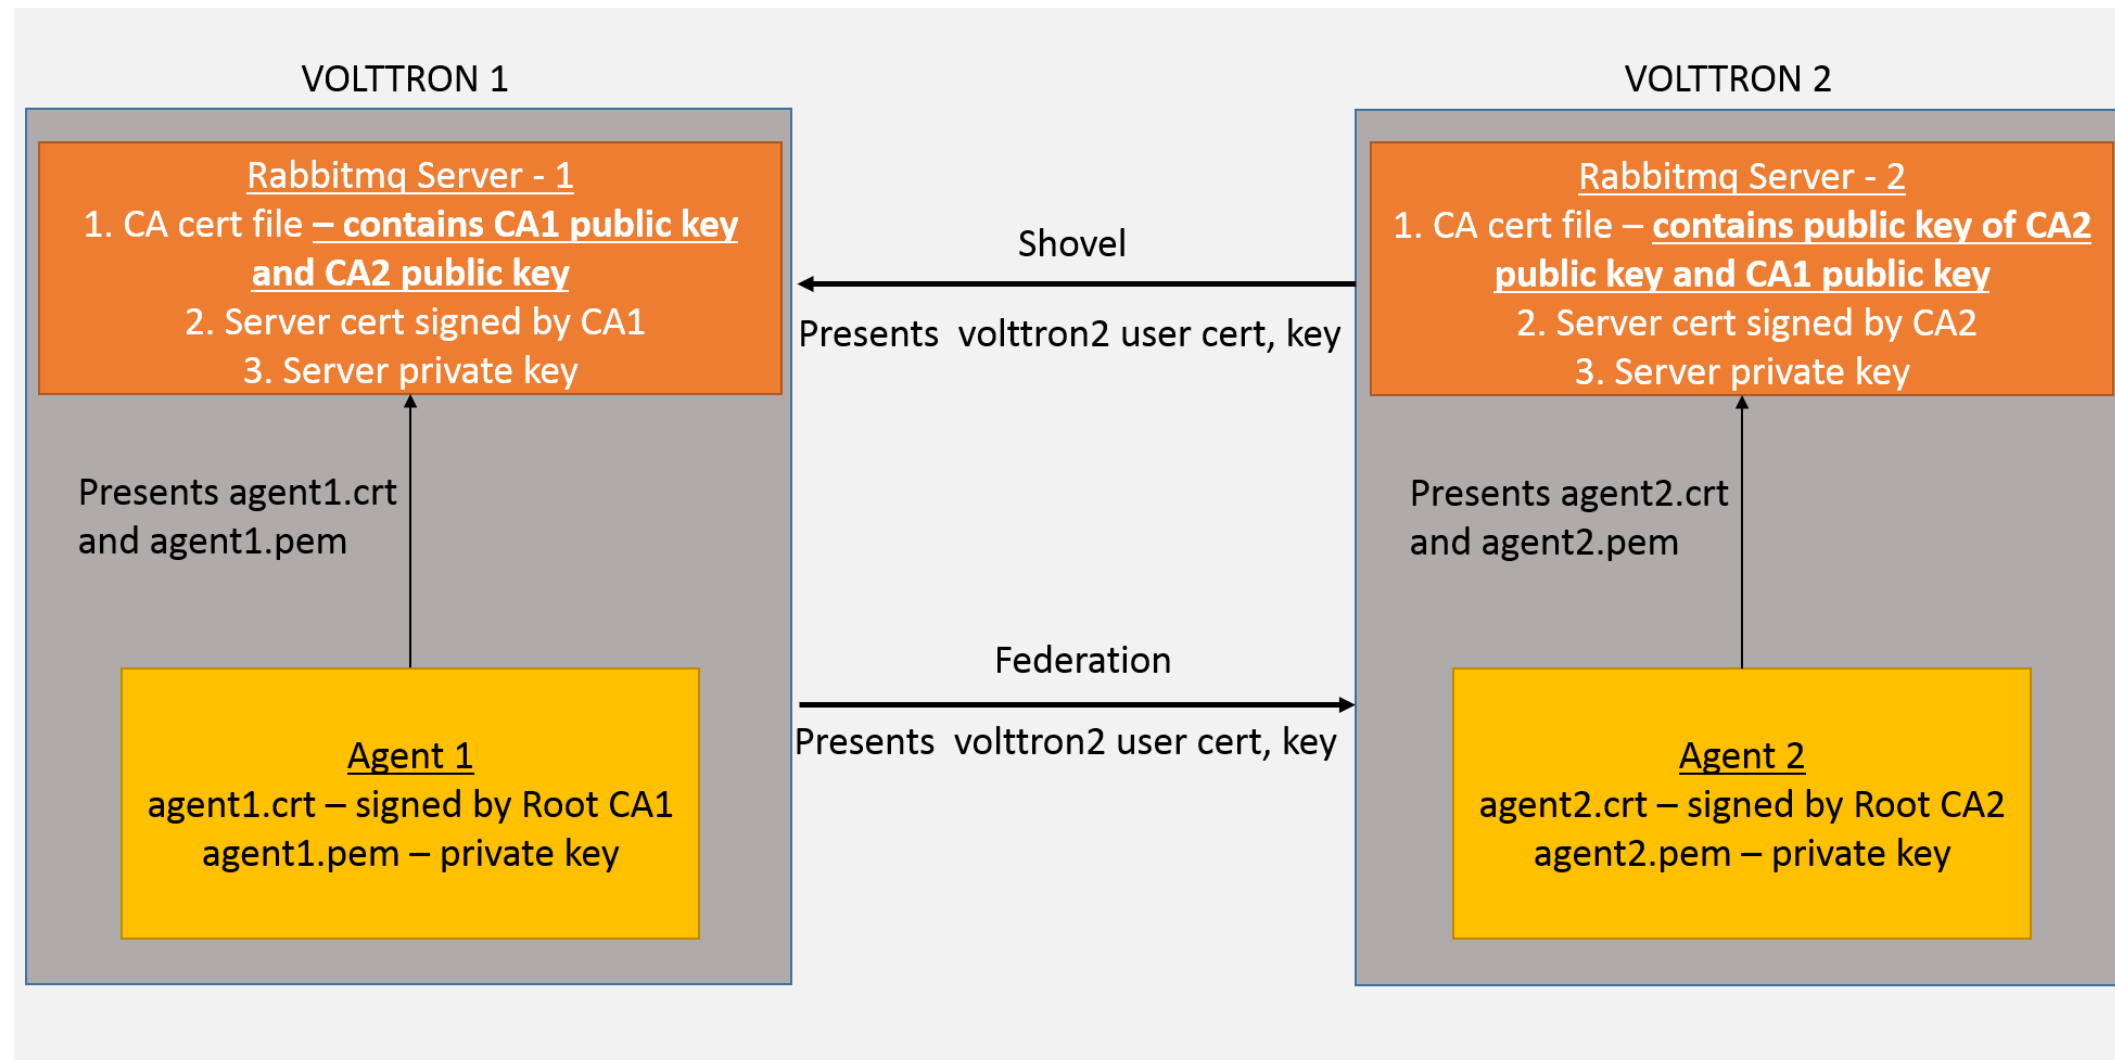

- RabbitMQ supports multiple authentication mechanisms
 - For VOLTRON we use SSL peer verification using with x509 certificates
- SSL certificates of interest
 - Root CA
 - Server certificate signed by Root CA
 - Client certificate signed by Root CA

RabbitMQ-VOLTTRON Authentication Using SSL

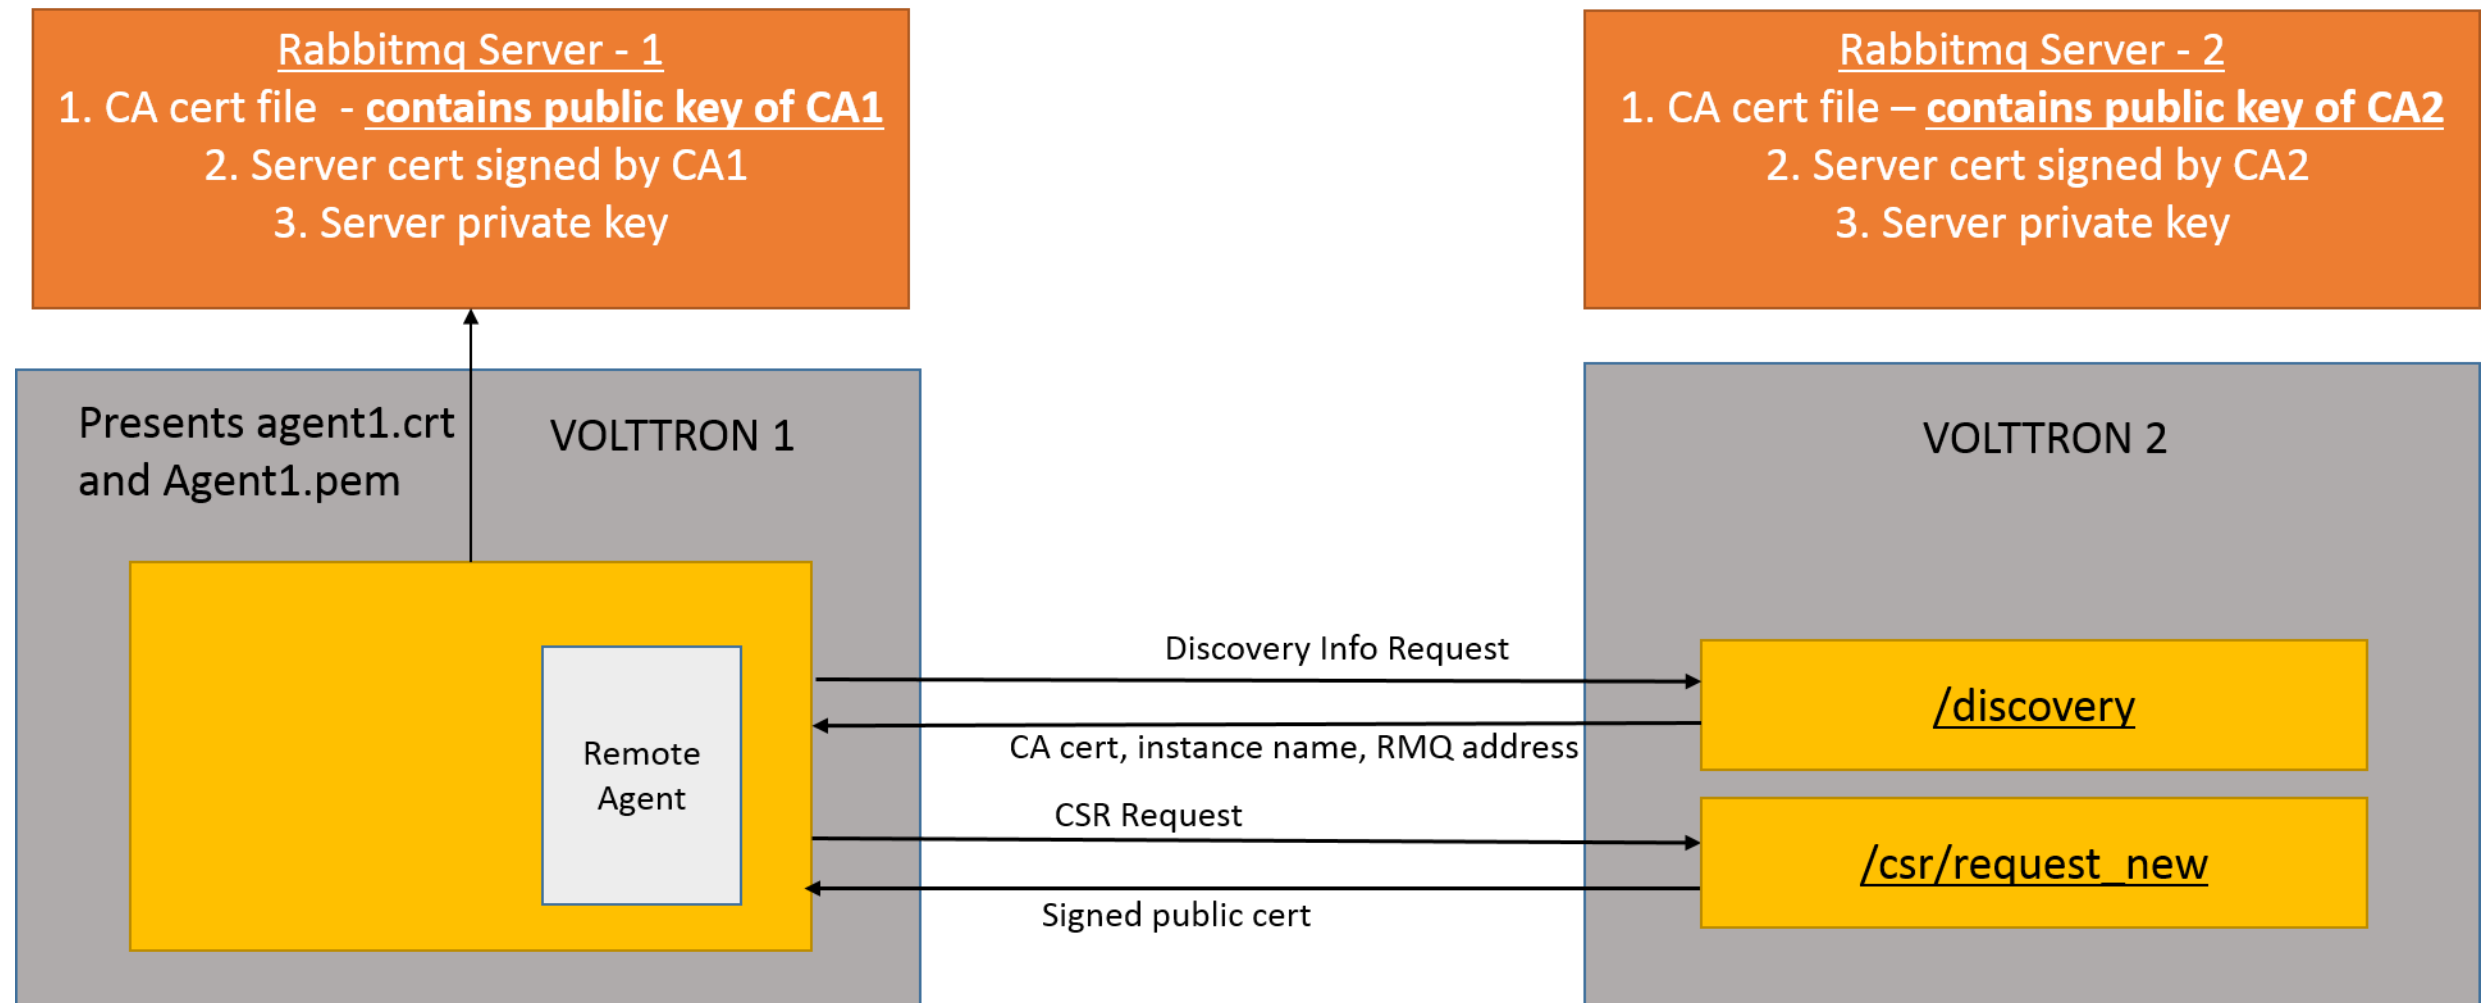

Multi-Platform Connection With SSL Certificates

Multi-Platform Connection with SSL certificates

Connecting To Remote Platform Using CSR

CSR Admin

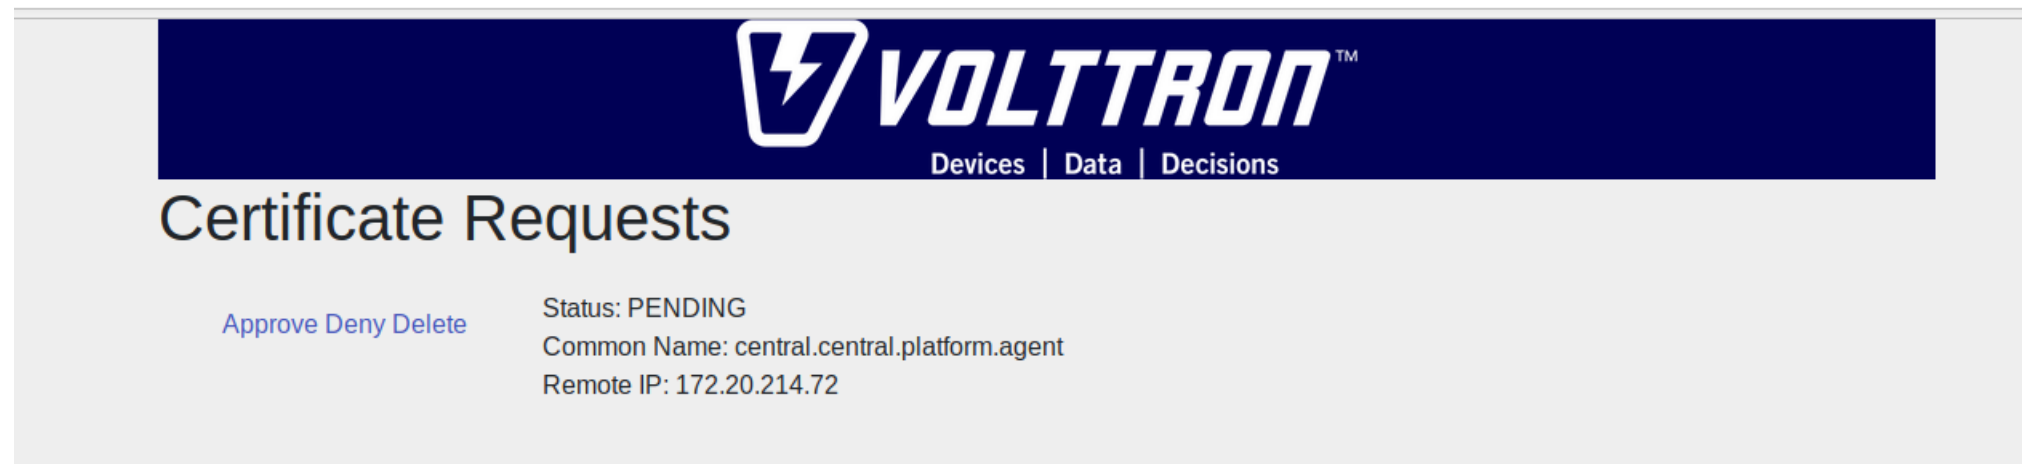

- CSR Admin Login – URL: `https://<hostname>:8443`

`/central:8443/admin/login.html`

The screenshot shows the Volttron CSR Admin Login page. At the top is a dark blue header with the Volttron logo (a lightning bolt in a shield) and the text "VOLTRON™" and "Devices | Data | Decisions". Below the header is the title "Authentication". There are two input fields: "Username:" with the value "admin" and "Password:" with masked characters "••••". A "Login" button is positioned below the password field.

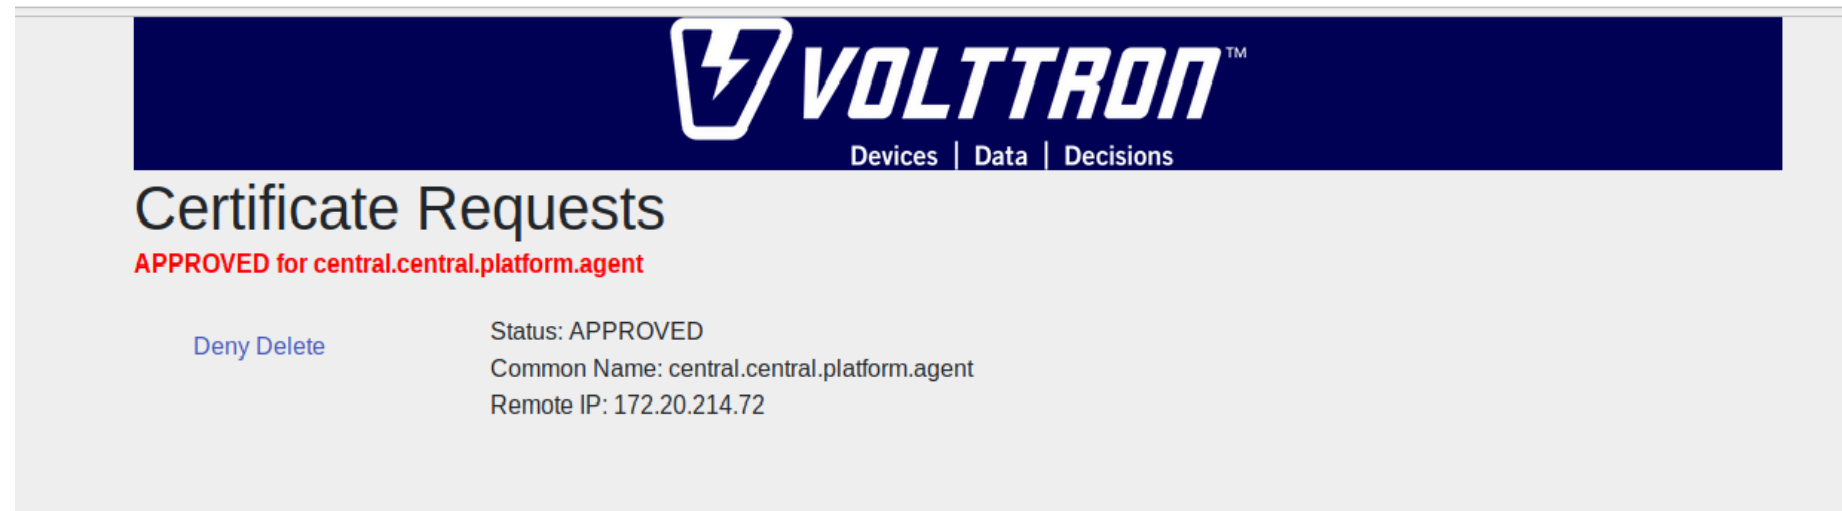

- CSR Request

The screenshot shows the Volttron CSR Admin Certificate Requests page. At the top is a dark blue header with the Volttron logo and the text "VOLTRON™" and "Devices | Data | Decisions". Below the header is the title "Certificate Requests". There are three links: "Approve", "Deny", and "Delete". To the right of these links, the status and details of a certificate request are displayed: "Status: PENDING", "Common Name: central.central.platform.agent", and "Remote IP: 172.20.214.72".

CSR Admin

- CSR Approved

VOLTRON™
Devices | Data | Decisions

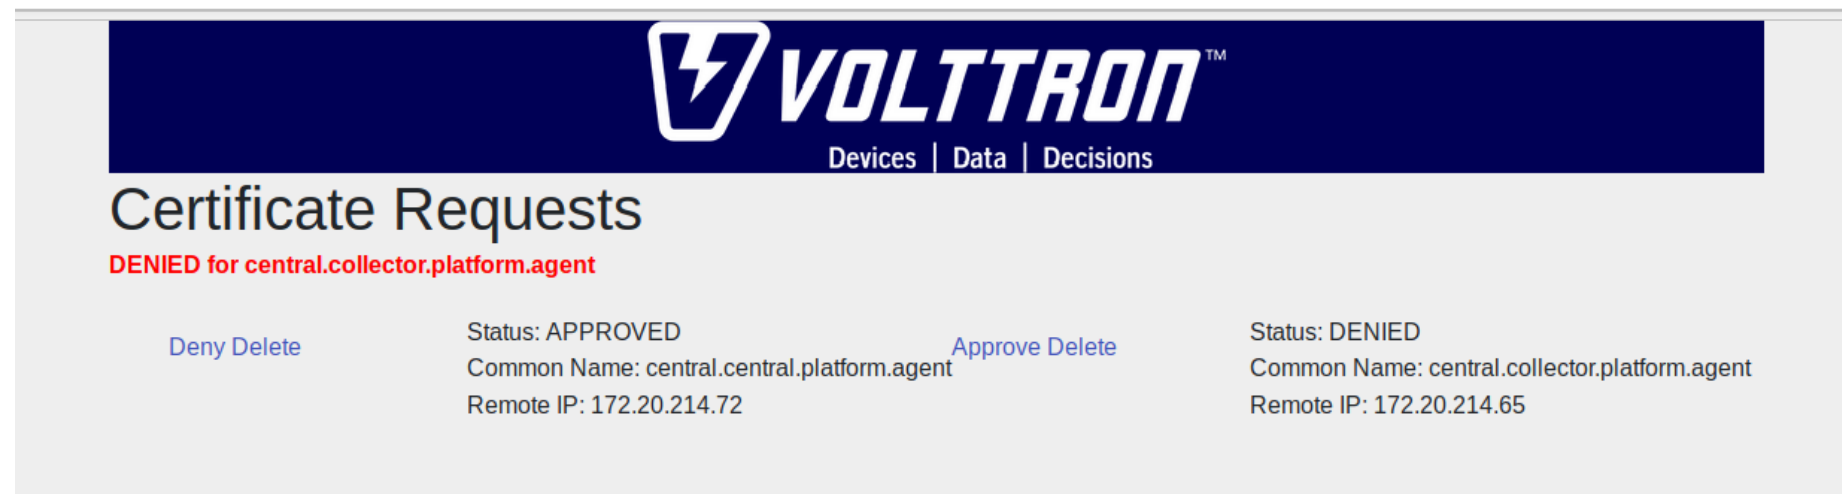

Certificate Requests

APPROVED for central.central.platform.agent

[Deny](#) [Delete](#)

Status: APPROVED
Common Name: central.central.platform.agent
Remote IP: 172.20.214.72

- CSR Denied

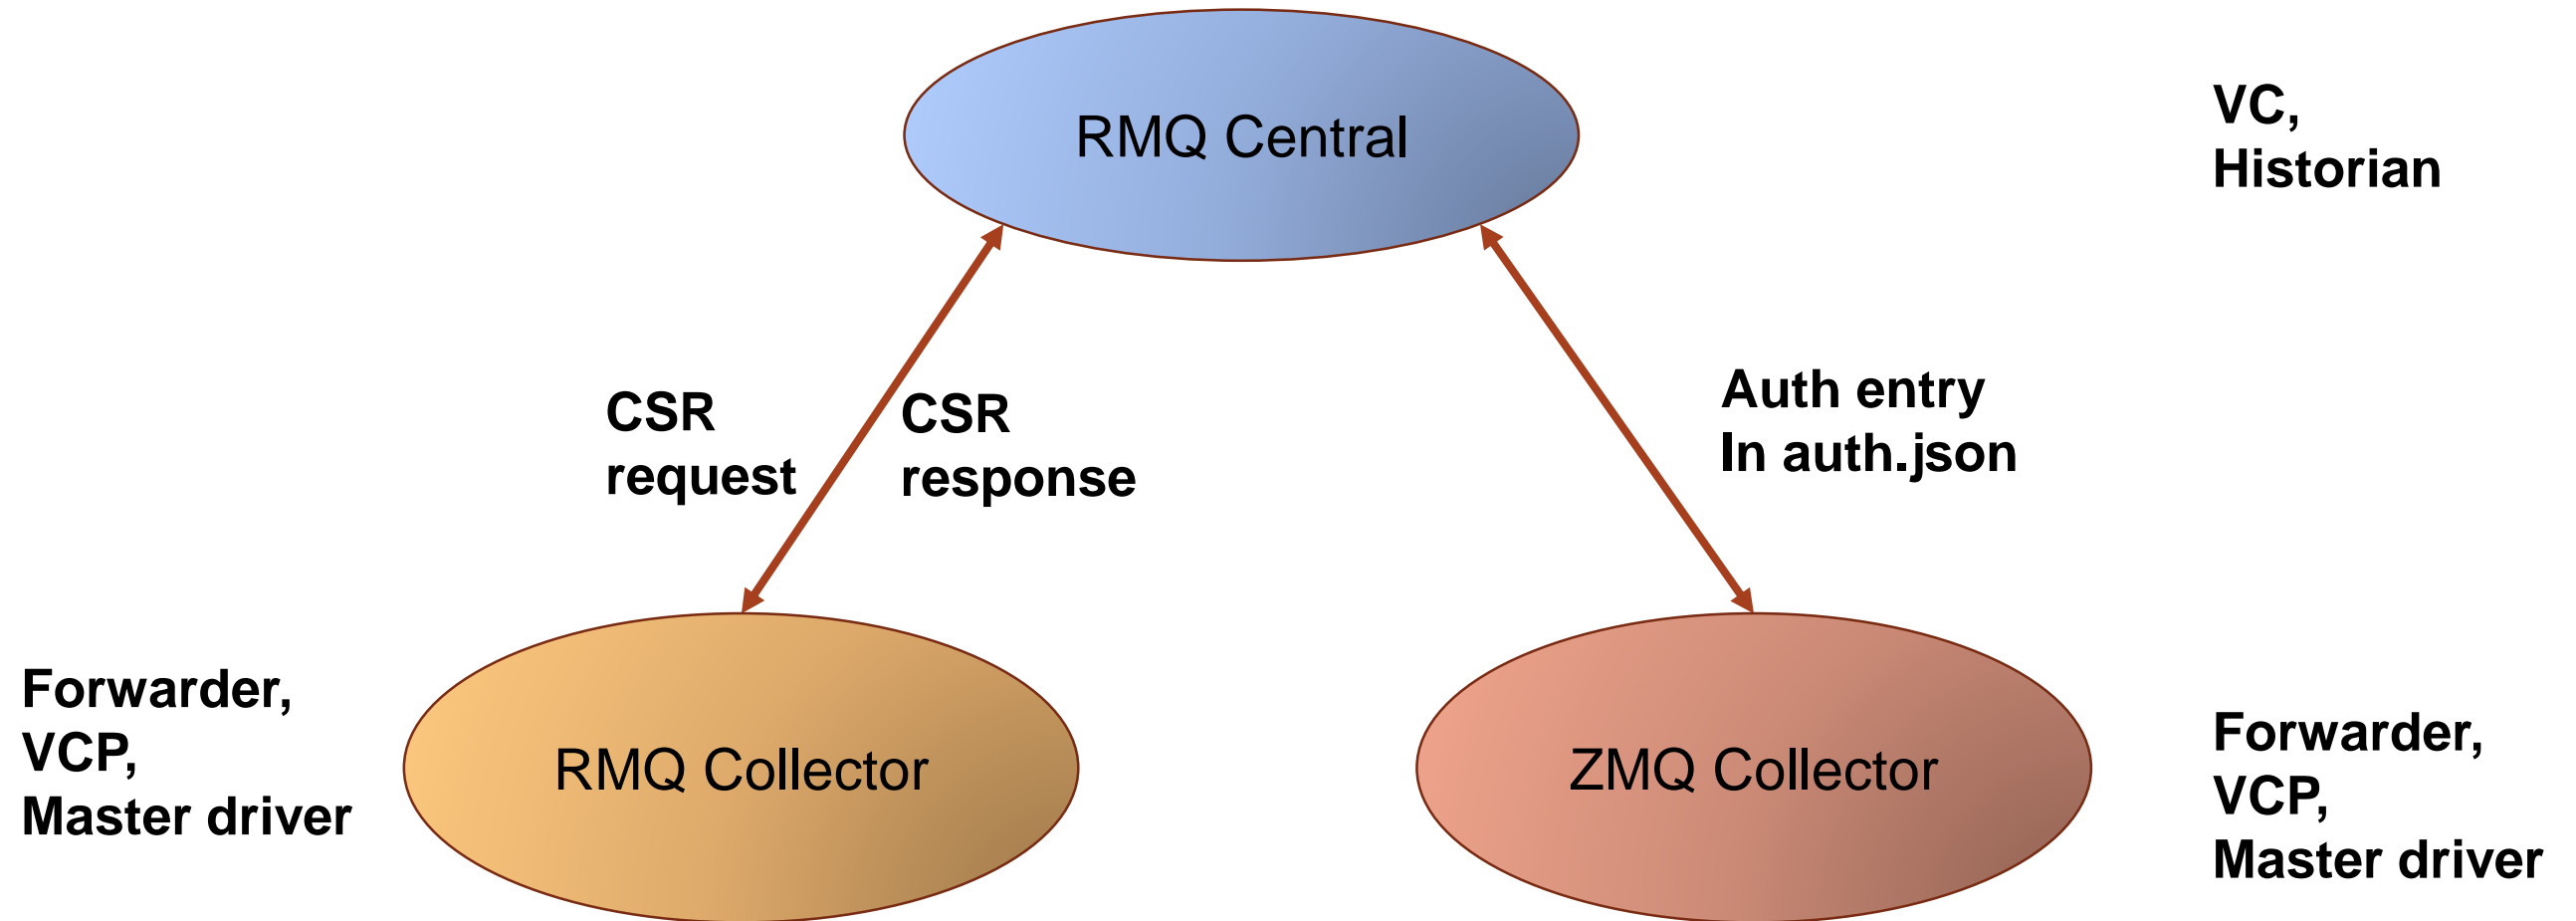

VOLTRON™
Devices | Data | Decisions

Certificate Requests

DENIED for central.collector.platform.agent

| | | | |
|---------------------------------------------|---------------------------------------------------------------------------------------------|------------------------------------------------|---------------------------------------------------------------------------------------------|
| Deny Delete | Status: APPROVED Common Name: central.central.platform.agent Remote IP: 172.20.214.72 | Approve Delete | Status: DENIED Common Name: central.collector.platform.agent Remote IP: 172.20.214.65 |
|---------------------------------------------|---------------------------------------------------------------------------------------------|------------------------------------------------|---------------------------------------------------------------------------------------------|

Multi-Platform Multi-Bus Connection

Volttron-ctl Commands For Creating Certificates

- Create a volttron public cert and private key for a new client

```
volttron-ctl certs create-ssl-keypair jackpot
```

New public cert will be `$VOLTTTRON_HOME/certificates/certs/<instance-name>.jackpot.crt`

New private key will be `$VOLTTTRON_HOME/certificates/private/<instance-name>.jackpot.pem`

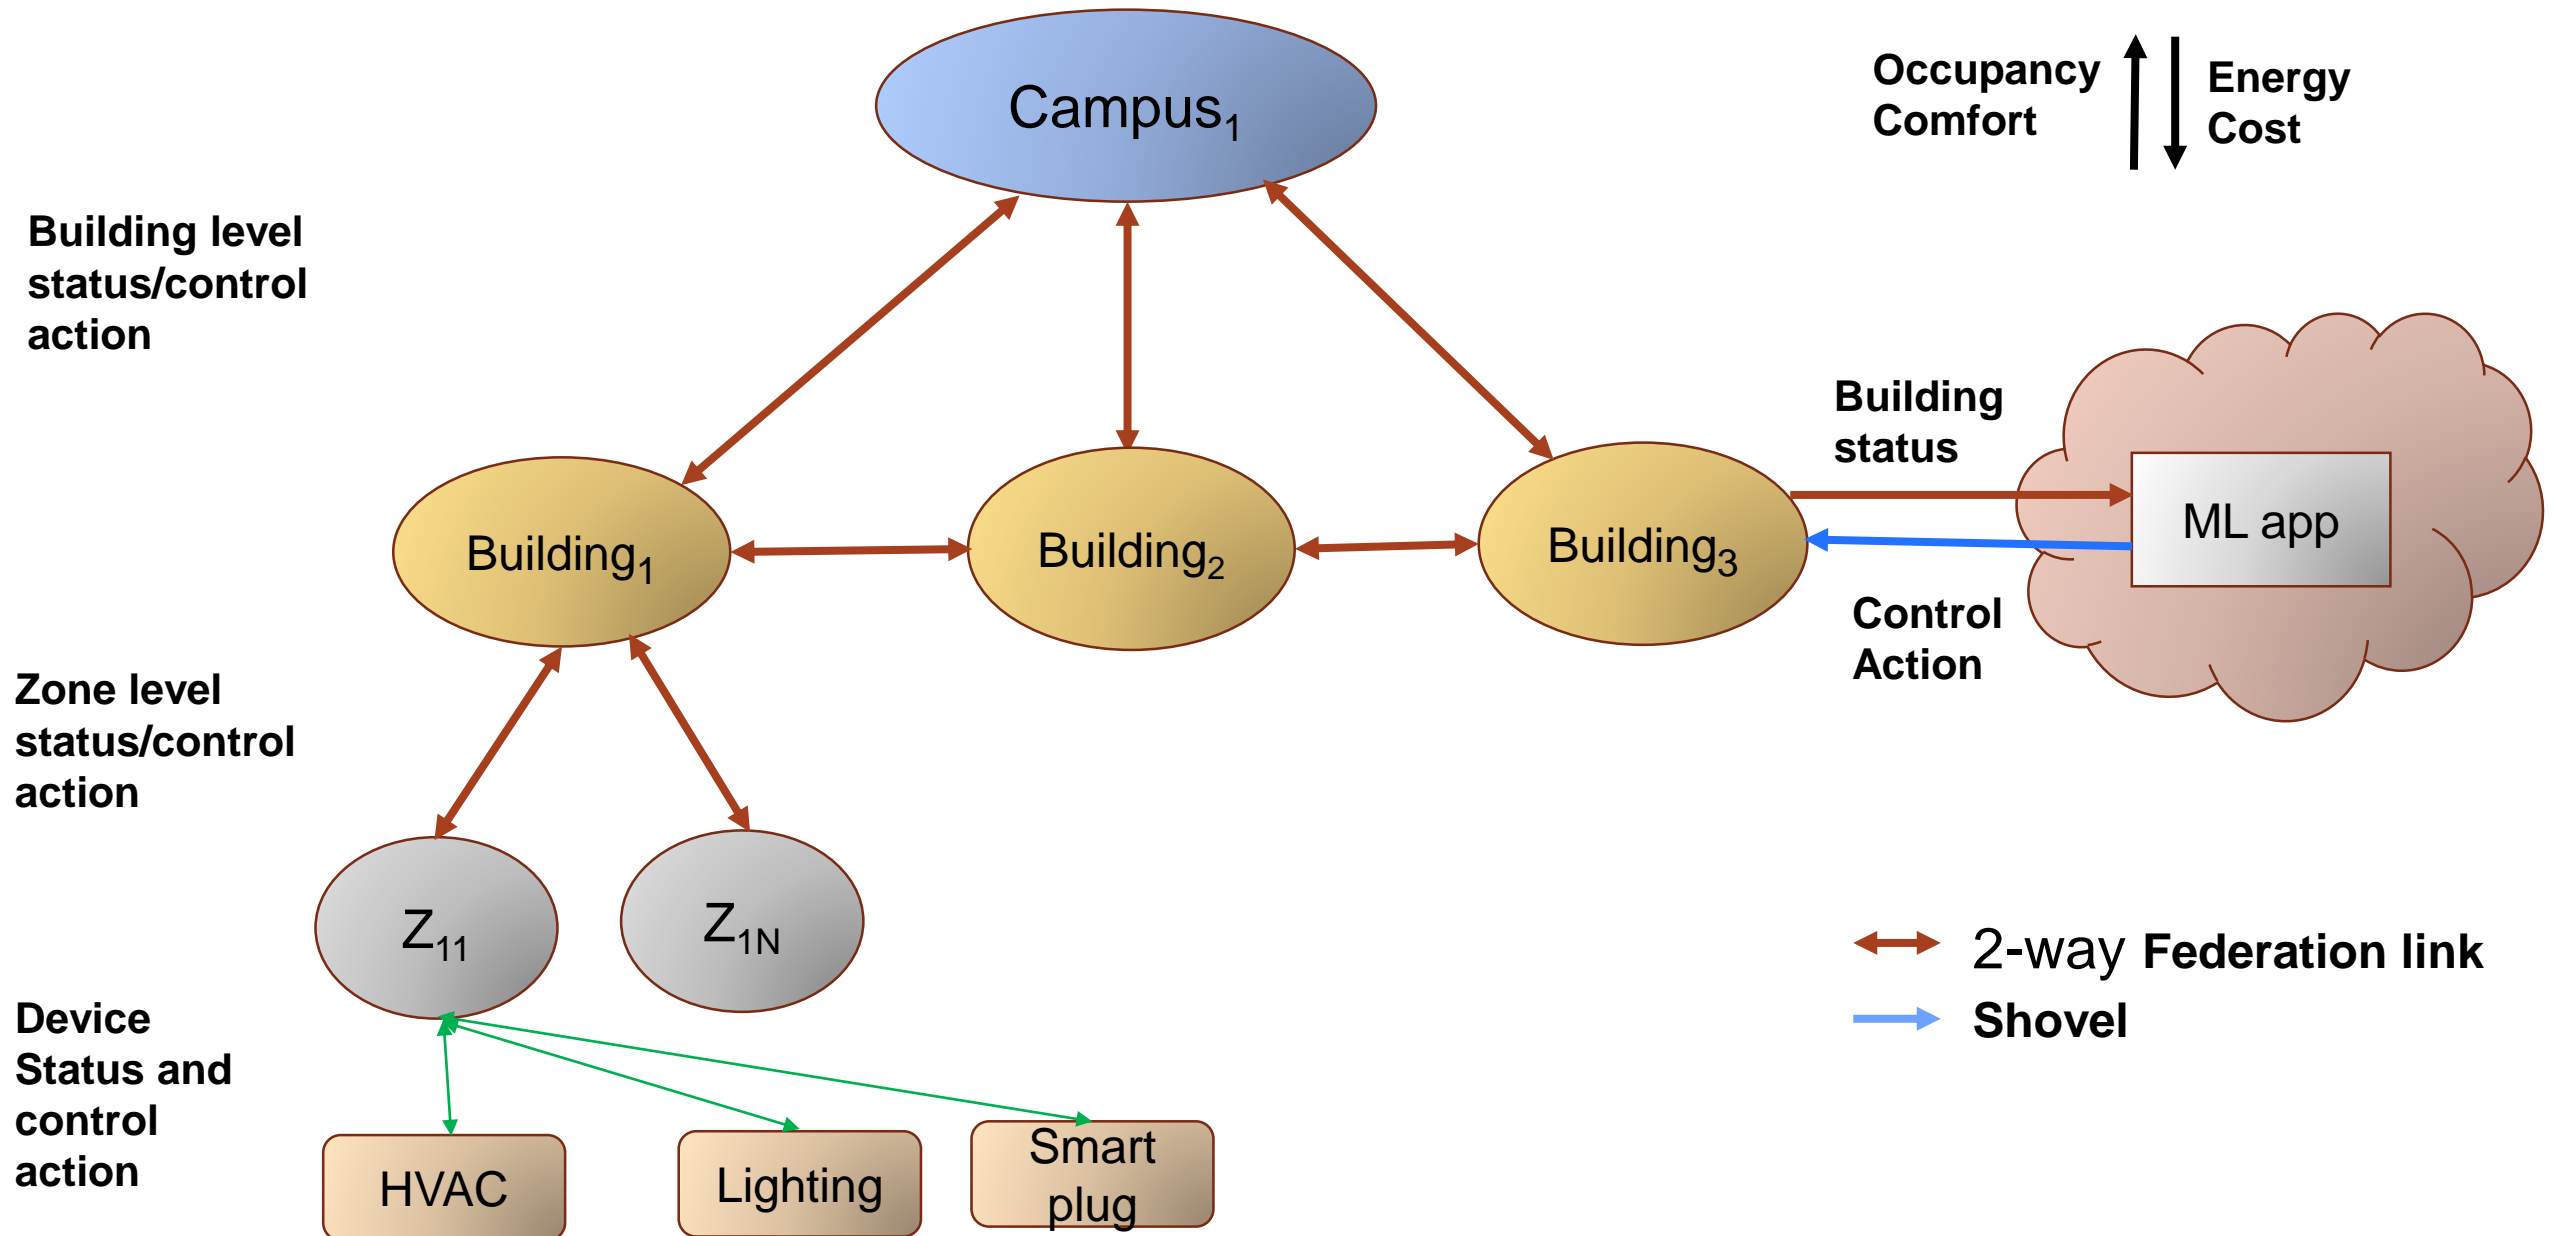

- Export the private key / cert into a PKCS12 format file

```
volttron-ctl certs export-pkcs-12 jackpot jackpot.12
```

New Options For VOLTTRON Users

- Offers more flexibility in deployment
 - Federation
 - Shovel
 - Highly scalable
 - ✓ Connect numerous buildings spread over large geographical area.

Deployment Use Case Example

Integration with 3rd party tools/applications

- Integration with non VOLTTRON RabbitMQ clients
 - Client connected to same broker
 - Connected to different broker. Connection established using federation/shovel
- ElasticSearch – For data ingestion and to perform analysis
 - ElasticSearch – For data ingestion and to perform analysis
 - ✓ Cybersecurity – to detect anomalies in data etc.
 - ✓ Visual Analytics
 - MQTT – For cloud based applications
- Github link: <https://github.com/VOLTTRON/external-clients-for-rabbitmq>

Next Steps

- Integrate federation and shovel setup with CSR
- Ease of deployment based on user feedback
