

Mask file

Required:

Always

Name:

User-specified

Read by:

InitTopoMap()

Format:

2D matrix

Purpose:

Contains a mask of the basin, indicating which cells in the other terrain, soil and vegetation files are inside the basin

Details:

- If the format is BIN or BYTESWAP, then an unsigned char should be used.
- If the format is NetCDF, then NC_BYTE should be used and the variable name in the NetCDF file should be Basin.Mask.
- The Outside basin value in the configuration file must be set to indicate which grid cells are outside the basin.
