# DOE's 17 **national laboratories** tackle critical scientific challenges

# PNNL is DOE's **most scientifically diverse national laboratory**

**5,000** Staff

**\$1.1B** Spending

**1,280** Peer-reviewed publications

**340** Invention disclosures

FY 2020 Staff

Enriching our  
community through  
**engagement,**  
**philanthropy,** and  
**volunteerism** is  
central to our mission

*This photo was taken before the COVID-19 pandemic*

# Plastics are an integral part of our global society

*they are light weight, durable, inexpensive, high performing sanitary, and more accessible than ever*

Food packaging

Automotive Industry

3D Printing

Modern Medicine

Flight & Aerospace

# From the golden days to today's plastic waste

**Single-use plastics**: primarily made from **fossil-fuel-based** chemicals and are meant to be disposed of **right after use**

# From the golden days to today's plastic waste

2020, plastic bags pile-up around the US as they wait to be processed

National Geographic, 2020

Videos: Plastic Pollution: How Humans are Turning the World into Plastic; A Plastic Wave – A documentary film on plastic pollution

# The scale of plastic production and waste

8.3 billion metric tons of plastic was produced between 1950 and 2015  
*more than 6.3 billion metric tons of plastic has become waste*  
*that is 79% of all plastic ever made*

6.9 km<sup>3</sup> of plastic waste

Almost 3000x the volume  
of the pyramid of Giza

# Plastic production relies on fossil fuel resources

8.3 billion metric tons of plastic was produced between 1950 and 2015

Videos: Plastic Pollution: How Humans are Turning the World into Plastic; A brief history of plastic – TED-Ed video

Raw materials are cheap and readily available. **But finite.**

4-6% of petroleum worldwide is currently used to produce plastic

we will end up utilizing **20%** of our petroleum resources on an annual basis by 2050

# Plastic production relies on fossil fuel resources

8.3 billion metric tons of plastic was produced between 1950 and 2015

Raw materials are cheap and readily available. **But finite.**

4-6% of petroleum worldwide is currently used to produce plastic

we will end up utilizing **20%** of our petroleum resources on an annual basis by 2050

# 1) Reduce 2) Reuse 3) Recycle

but applying the three R's effectively toward single-use plastic is difficult

# 1) Reduce 2) Reuse 3) Recycle

bans on different plastic items (plastic bags, straws) aim to minimize single-use plastic straws, lids, wrappers – are among the most common packaging items found in litter

The Breeze, OpEd. Kat Ellis  
April 2018

# 1) Reduce 2) Reuse 3) Recycle

the Covid-19 pandemic reinforced our reliance on single-use plastic  
At the same time...

- bans on plastic grocery bags were lifted
- coffee shops stopped accepting reusable mugs
- take-out and online businesses boom

The Breeze, OpEd. Kat Ellis  
April 2018

personal protective equipment

vaccine distribution

# 1) Reduce 2) Reuse 3) Recycle

resin identification codes provide a guide to recyclability

95% of plastic packaging material value, or **USD 80–120 billion annually**, is lost to the economy after a short first use.

Plastics that do get reused/recycled are mostly **downcycled**

Single-use plastics are better targeted through initiatives that **reduce** rather than recycle

# What about the rest of the plastic waste?

**Only 9% of all plastic waste  
has ever been recycled**

**12% was incinerated for  
energy recovery**

# What about the rest of the plastic waste?

By 2050 there could be more plastic than fish in the ocean

In the environment, plastics break down into **microplastics**

The Great Pacific Garbage Patch is a collection of microplastics floating in the Pacific Ocean with est. 1.8 trillion pieces

Plankton eat the microplastics, fish eat the plankton, we eat the fish

Impact on human health is **unknown**

**The rest ends up in the landfills and in our environment**

Lebreton, L.; et. al.; Evidence that the Great Pacific Garbage Patch is rapidly accumulating plastic. Scientific Reports 2018, 8 (1).  
Video: Are you eating plastic for dinner?

# So how can we incorporate plastics into society more responsibly?

1. Today, plastics are everywhere
2. A linear plastics economy is bad for the environment and economy
3. The vision of a circular economy is that plastic never becomes waste

3. The vision of a circular economy is that plastic never becomes waste

# So how can we incorporate plastics into society more responsibly?

## Chemical Upcycling:

The process of selectively converting discarded plastics into chemicals, fuels, or materials with **higher value**, ideally using a ***catalyst*** to *minimize energy input and consumption*

1. Today, plastics are everywhere
2. A linear plastics economy is bad for the environment and economy
3. The vision of a circular economy is that plastic never becomes waste
4. Chemical upcycling and catalysis will help enable a circular economy

# How did I end up working on this problem?

**Grew up in the PNW**  
**BS Chemistry, WWU, 2011**  
**Undergraduate research - introduction**  
**into the world of catalysis**

**PhD in Inorganic**  
**Chemistry/Catalysis, 2018**  
**University of Michigan**

**Postdoctoral Research**  
**Industrial Catalysis, 2018-2020**  
**UC Berkeley w/ DOW chemicals**

**Postdoctoral Research, 2020 - today**  
**Catalyst design for Plastic Upcycling,**  
**PNNL**

**Dr. Julie Rorrer/Color me PhD**

# What is a catalyst?

# What is a catalyst?

a catalyst speeds up a  
chemical reaction

lowers the energy required for  
a reaction to occur

provides an alternative  
pathway for the reaction

remains unchanged – is not  
used up in the reaction

# Without catalysis we would not have...

Catalysts are used to upgrade crude oil and fossil fuel-based chemicals into the products and materials we rely on

plastics

fertilizer

fuels

# Without catalysis we would not have...

Catalytic upcycling could enable production of these high value products directly from plastic waste, creating a closed looped process

*We can use the tools of synthetic chemistry, material science, analysis, theory, and engineering to design new more efficient catalysts*

# Plastic materials are made to last

Why are plastics so difficult to break down?

How do we design a catalyst that can break them down fast and into products that we want?

## Plastic materials are made to last

Why are plastics so  
difficult to break  
down?

How do we design a  
catalyst that can  
break them down  
fast and into  
products that we  
want?

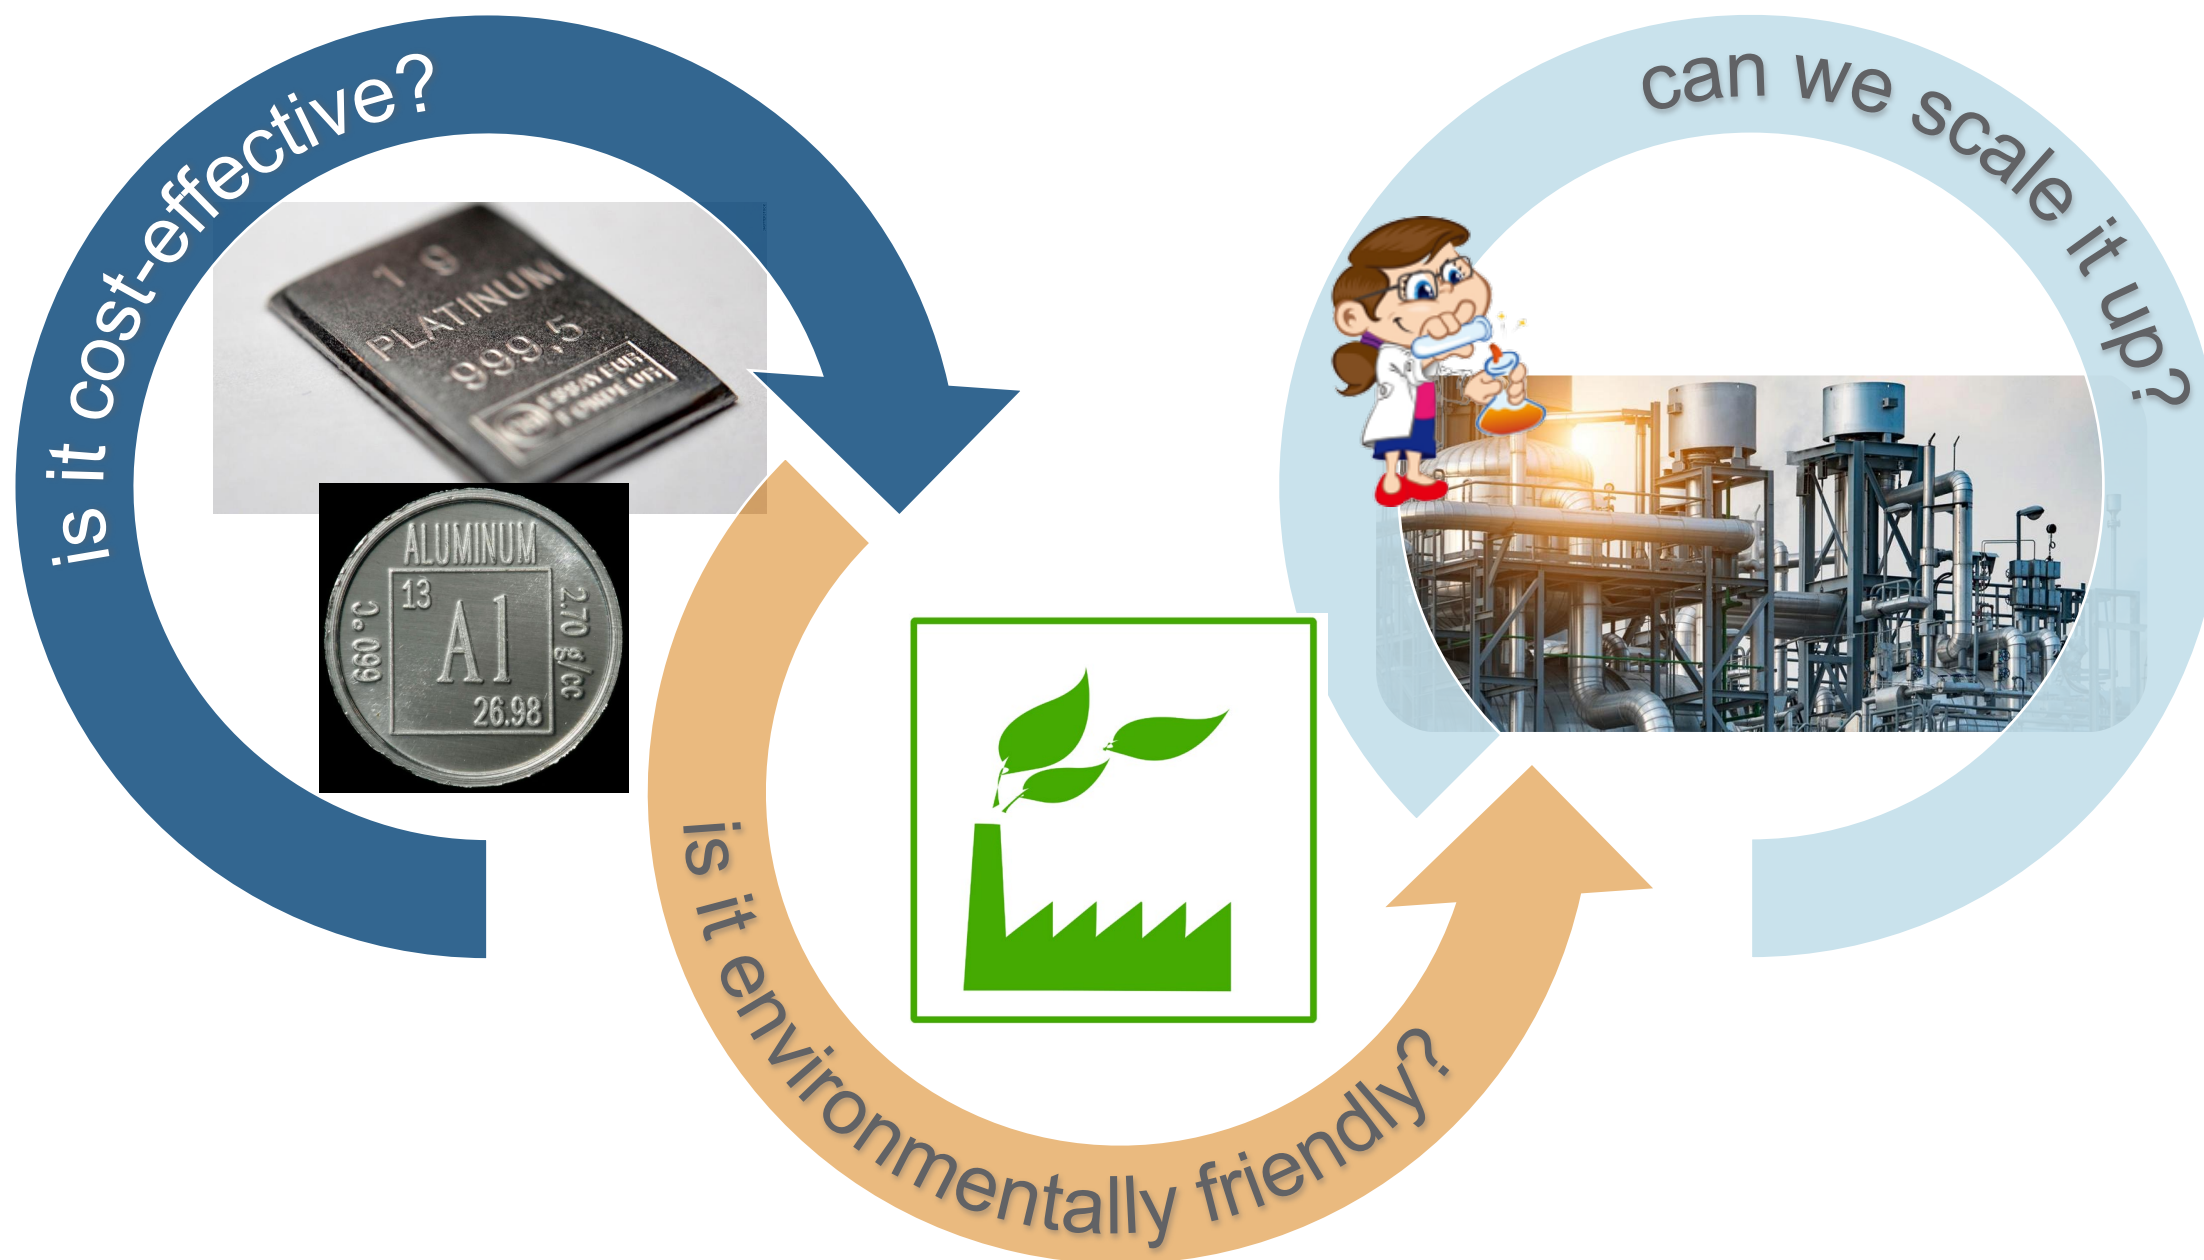

# How do we design a catalyst for plastic upcycling?

Just as engineers fit together parts to build a complex machine...  
Chemists use the periodic table to combine elements into a working catalyst

# Choosing the right catalyst for a sustainable process

# We are pioneering low-temperature catalytic processes for upcycling plastic packaging

Plastics feedstocks

catalyzed  
process

uncatalyzed  
process

- Our catalyst works at temperatures 3x lower than current catalytic technologies
- The catalyst can be recycled up to 7x
- Selective product distribution

# My job is to understand how the catalyst works

What does it look like?

How does it bind to plastics and break the chemical bonds?

How fast does it go under various conditions?

# What does this mean for you?

If we can understand, improve, and build on the chemistry behind plastic upcycling catalysis we will help to:

**Take plastic waste out of the landfill  
and out of the ocean**

**Decouple the production of plastics  
with the use of fossil fuels**

**Recover the material value lost from  
single-use packaging by creating  
higher value products**

# Solving big problems starts with a great team
